Public Acceptance of International Redistribution in High-Income Countries

Abstract

Using an original survey of 12,000 respondents representative of eleven high-income countries (the United States, Japan, Russia, Saudi Arabia, and seven European countries), I examine public support for international redistribution and climate policies, as well as its sensitivity to key policy features such as the size of transfers and country coverage. Although global inequality is not a salient concern, it is perceived as a significant injustice. There is majority acceptance in every country for nearly all global policies tested, including those that would redistribute 5 percent of global income or entail personal costs for respondents. An information treatment shows that support for global policies causally increases among respondents who perceive them as likely; an effect opposite to warm glow. Support for international policies decreases only slightly as country coverage shrinks. Overall, the results suggest that a broad coalition of countries could feasibly advance sustainable development.

1 Introduction

In all international fora, Global South countries seek a more equal world order. Indeed, redirecting just 1% of high-income countries' output to low-income countries (LICs) would mechanically double their national income.Public attitudes in high-income countries (HICs) are key to understanding whether globally redistributive policies would be politically feasible.

Fabre et al. (2025) conduct survey experiments in the U.S. and four Western European countries to understand this mismatch, focusing on a "Global Climate Scheme" (GCS) costly to these countries. The authors reject hypotheses that support for the GCS might be overstated: they find no social desirability bias in a list experiment, 6 out of 10 respondents prefer a political program that includes the GCS over one that does not, and most respondents are willing to sign a petition in favor of the GCS. Therefore, Fabre et al. (2025) conclude that support for global redistribution is genuine but could not explain the lack of prominence of this issue.

In this paper, I conduct a pre-registered large-scale survey to examine whether global redistribution policies are robustly accepted and to investigate the reasons for their lack of prominence. Surveying eleven HICs, I test whether international policies are accepted by majorities in countries not yet surveyed on this topic, such as Japan, Poland, Russia, Saudi Arabia, and Switzerland. Recognizing that some key countries would likely not participate if these policies were implemented, I test how acceptance is affected when a climate scheme or a wealth tax is international but not truly global. I explore three other mechanisms that could explain the preference–prominence gap: pluralistic ignorance; the salience of global redistribution and whether it is vote-determining; and "warm glow" (expressing support for hypothetical policies only as long as they seem unlikely). Finally, I explore a variety of international policies, ranging from the plausible to the radical.

I find majority acceptance[1] in every country surveyed for almost all globally redistributive policies tested. Policies currently discussed in international negotiations are accepted by large majorities. Radical proposals are also widely accepted. Majorities in every country agree that "governments should actively cooperate to have all countries converge in terms of GDP per capita by the end of the century", and that globally coordinated climate policies are preferable to the status quo, even if they entail completely electrifying cars by 2045 and doubling the prices of heating fuel, flights, and beef. Overall, I find 64% acceptance for a progressive income tax collecting 5% of world income to finance poverty reduction in the Global South. In an interactive task where respondents design their preferred global income redistribution, nearly half choose a redistribution that would make them poorer (versus less than 10% choosing one that would make them richer), and the average custom redistribution entails over 5% of world income in transfers from the rich to the poor.

While policies to address global inequality are widely accepted, they have low salience. Indeed, this topic is rarely mentioned in open-ended fields at the beginning of the survey, where respondents were asked to write about various considerations. Respondents' top concern is the cost of living, and their most frequent wish is for greater purchasing power. While inequality is most often regarded as the greatest injustice, global inequality almost never appears among issues respondents consider important but neglected in public debate. The low priority placed on global redistribution may explain why it is seldom discussed in public debates, despite widespread acceptance of related policies.

Despite its low salience, global redistribution may be a vote-determining issue for some people, as the conjoint experiment suggests. In this task, respondents express their preference between two political programs, each composed of policies randomly selected

[1]Throughout the paper, I make a distinction between *support* and *acceptance*. I use the term *support* to refer to the absolute share of *Somewhat* or *Strong support* on Likert scales, and *acceptance* to refer to relative support —specifically, the support share among non-*Indifferent* responses.

from those prominently debated in their country. When a program includes a *global tax on millionaires with 30% of the revenue funding LICs*, the likelihood of that program being preferred increases by 5 p.p., while *cutting development aid* reduces it by 3 p.p. A direct question confirms that some voters might change their vote intention if a candidate campaigned on sustainable development: 36% of respondents report they would be more likely (versus 17% less likely) to vote for a party if it participated in a global movement for climate action, taxes on millionaires, and poverty reduction in LICs. In a related question, 68% of respondents (and 52% of the 561 millionaires who responded) state they could actively participate in such a movement.

What if a sustainable development policy is international but not global? Acceptance decreases only slightly: from 74% to 68% for a wealth tax with 30% of revenue financing LICs when only some countries participate, and from 68% to 65% for an International Climate Scheme when participating countries shrink from 72% to 33% of world emissions.

I identify pluralistic ignorance through an incentivized question that asks respondents for their belief regarding support for the Global Climate Scheme, either among their compatriots or in the U.S. Overall, the median respondent underestimates support in their own country by 16 p.p. and non-American respondents underestimate support in the U.S. by 22 p.p. Pluralistic ignorance may be an important reason why global solidarity solutions are neglected.

To test whether support might drop if the prospect of global policies materializes (a form of *warm glow*), I manipulate the belief that large international transfers are likely in the next fifteen years. More specifically, I inform a random half of the respondents that "countries have agreed to demonstrate some degree of solidarity in addressing global challenges", providing diverse examples. The information treatment increases the belief that transfers are likely by 7 p.p. from a baseline of 33%, and it also *increases* the share of global policies supported by 1 p.p. An IV estimation shows that the share of policies

supported causally increases by 18 p.p. when people believe that international transfers are likely, consistent with the non-causal effect estimated by OLS. In other words, I find no evidence of *warm glow*. On the contrary, the effect goes in the opposite direction: if people believe that a global policy is likely, they are more likely to support it (which can be interpreted as a *status quo* bias).

Finally, I test respondents' broad values to verify their consistency with global redistribution. The majority of respondents agree that "helping countries in need is the right thing to do". However, only a minority is convinced that it is in HICs' long-term interest to do so, or that it is their historical responsibility. Similarly, there is no majority support for reparations for colonization and slavery in the pooled sample. These results suggest that support for global solidarity is driven by a sense of empathy and duty rather than guilt or interest.

Universalism has been identified as one of the best predictors of voting behavior (Enke 2020) and ideology (Cappelen et al. 2025a; Enke et al. 2023), particularly in Western countries (Cappelen et al. 2025a). I use a new question to measure universalism, asking respondents which group they advocate for when they vote. 45% choose a universalist response (either "Humans" or "Sentient beings (humans and animals)"), while 32% opt for their fellow citizens. Universalism is a stronger predictor of policy attitudes than sociodemographic variables such as income, country, or even vote choice. Besides, there is a majority of universalists in Europe, Saudi Arabia, and among left-wing voters.

This observation aligns with the cross-national differences observed in synthetic indicators: Saudi Arabia, Italy, and Spain exhibit the highest levels of support for global redistribution, while Japan, Switzerland, the U.S., and Poland show the lowest.

Related literature. There are few cross-country surveys on international policies. They consistently find strong public support for global redistribution (Fabre et al. 2025), in-

cluding a globally coordinated tax on billionaires (Cappelen et al. 2025b) or a democratic world government for global issues (Ghassim & Pauli 2024).

The first questions on respondents' considerations contribute to an extensive literature in political science on "issue salience"—the priority attributed to a given issue. Issue salience is now widely acknowledged as a key factor in determining voting behavior (Dennison 2019; Edwards et al. 1995; Egan 2013; Krosnick 1988; RePass 1971). Furthermore, the "most important issues" in open-ended responses relate to the economy and healthcare (Wlezien 2005). Although climate change and hunger appear in the top five problems when the question is framed at the global rather than national level (Yeager et al. 2011), public acceptance of sustainable development policies may be overshadowed by more pressing concerns in voters' choices. Meanwhile, 40% of Norwegian respondents cite the international distribution of costs in an open-ended question about climate change injustice, by far the most cited category (Gregersen et al. 2025).

The finding of pluralistic ignorance echoes similar findings documented regarding climate action (Andre et al. 2024a,b; Mildenberger & Tingley 2019), the billionaire tax (Cappelen et al. 2025b), and the GCS (Fabre et al. 2025).

Although this paper focuses on multilateral policies, it relates to the literature on attitudes toward foreign aid. Kaufmann et al. (2019) and Fabre et al. (2025) find that, despite substantial overestimation of aid amounts, desired aid exceeds perceived aid in most countries. Hudson & van Heerde (2012) provide a critical review of the literature and show that the strong support for poverty alleviation largely stems from intrinsic altruism, in line with Eurobarometer data (Cho 2024).

Nair (2018) finds that Americans underestimate their rank in the global income distribution by 27 percentiles on average and overestimate the global median income by a factor of 10, which lowers their support for foreign aid. Similarly, Fehr et al. (2022) find that 9 out of 10 Germans express support for global redistribution, even though respon-

dents underestimate their position in the global income distribution by an average of 15 percentiles.

Finally, the paper contributes to the literature on free-riding and country coverage in climate agreements. Beiser-McGrath & Bernauer (2019) demonstrate that climate agreements with broader country coverage are more likely to be preferred. In Germany and the U.S., Gampfer et al. (2014) find stronger support for funding climate action in low-income countries when the cost is shared with other countries. Nevertheless, surveys consistently show support for unilateral climate action (Bernauer & Gampfer 2015; McGrath & Bernauer 2017). Aklin & Mildenberger (2020) show that the evidence for free-riding is not compelling and that climate inaction can be equally well explained by distributive conflicts. Still, while survey evidence indicates some degree of conditional cooperation (Carlsson et al. 2025; Tam et al. 2025).

2 Data and Design

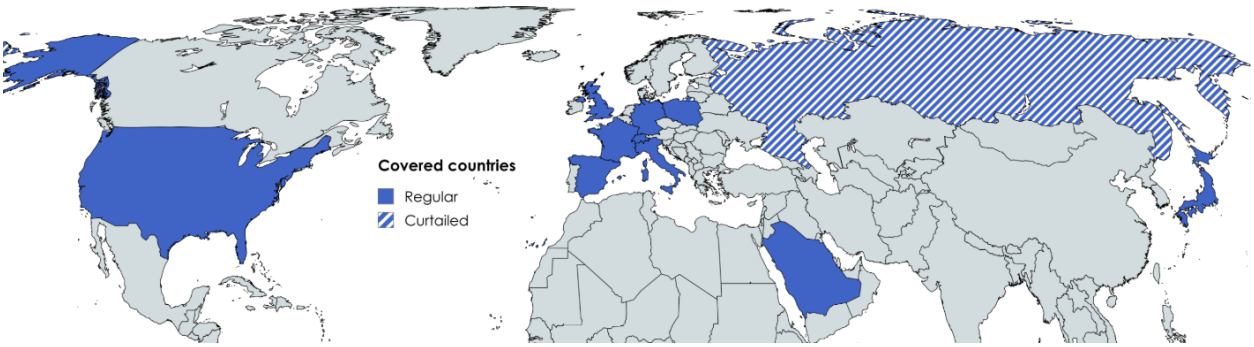
Samples. I conducted an original survey of 12,001 respondents representative of the adult population in eleven high-income countries (see Figure 1). The countries were chosen to span the diversity of high-income countries and the sample sizes to be commensurate with each country's population size.[2] The survey was fielded online in 2025 using *Yandex* (for Russia), *Kantar* (for Saudi Arabia), and *Bilendi* (for the other countries).

In Russia, I could not administer the same questionnaire as in the other countries. I had to curtail it due to platform limitations (I could not use *Qualtrics*) and preventive censorship by the survey company. In the other countries, the questionnaires are almost identical, though the figures in the questions are adapted to the country-specific context

[2]The sample sizes are as follows: U.S.: 3,000; Japan: 2,000; Russia: 1,001; Saudi Arabia: 1,000; Europe: 5,000, split in proportion to the countries' adult population sizes (except for Switzerland), i.e. France: 798; Germany: 1,048; Italy: 756; Spain: 603; UK: 826; Poland: 500; Switzerland: 469. The maximum margins of error (at the 5% threshold) for country samples range from ± 1.8 p.p. in the U.S. to ± 4.5 p.p. in Switzerland.

(e.g. respondents are informed about the cost of the Global Climate Scheme to the average person in their country).[3]

Figure 1: Country coverage of the survey.



Representativeness. The samples are stratified to be representative of the country's adult population based on gender, age (5 brackets), income (4), diploma (3), region (2 to 5), and urbanicity (2 to 3), with some exceptions.[4] The samples closely match the actual population frequencies along these dimensions(see Tables S1-S4 in S.I. B). All results are reweighted to be fully representative along the quotas, with weights trimmed between 0.25 and 4. Results aggregated at the global or European levels weigh each country in proportion to its adult population size. Descriptive results on a random branch use weights that are recomputed within that subsample.

Sociodemographic variables explain 10% to 15% of the variance in the main attitudinal outcomes, dropping to 5% after accounting for country and vote (Figure S27). In contrast, our measure of universalism is a stronger predictor than any sociodemographic variable. Support is highest among left-wing voters and lowest among far-right voters, with non-voters exhibiting attitudes close to the center of the political spectrum (S.I. G). Besides, attitudes are much less polarized in Japan compared to Europe and the U.S. Figure S26

[3]S.I. H lists the unique features of the questionnaire in each country.

[4]In the U.S., I also use race (4 categories). In Saudi Arabia, I use citizenship (Saudi vs. non-Saudi) instead of urbanicity. In Russia, I do not use region nor urbanicity.

shows voting patterns similar to the actual distribution, although the proportion of self-reported non-voters is lower than in reality. Additionally, the main results are robust to reweighting by vote.

Data Quality. The median survey duration is 17 minutes (13 min in Russia). Best practices have been implemented to ensure top-notch data quality (Stantcheva 2023). The questionnaire was carefully worded in a neutral and informative way;[5] tested on random people in public spaces to ensure correct comprehension; translated by professional translators, with figures converted into national currencies; and double-checked by native speakers.

Of all respondents allowed to continue (as their quotas were not full), 17% dropped out (including 10% who dropped out after the socio-demographic questions). The final sample excludes 16% for suspicion of low quality: 9% for failing an attention test and 13% for completing the questionnaire in less than 6 minutes[6] (including 5% for both reasons). There is no correlation of treatment arms with attrition (S.I. D), and the main results replicate in the extended sample.

The order of question items is randomized whenever possible. Item order generally has a significant but small effect on answers (2 to 14 p.p.), as shown in S.I. H. The size of this effect helps identify questions for which opinions are strongly held (e.g. a preference for a sustainable scenario over the status quo) versus weakly held (e.g. the preferred amount of climate finance).

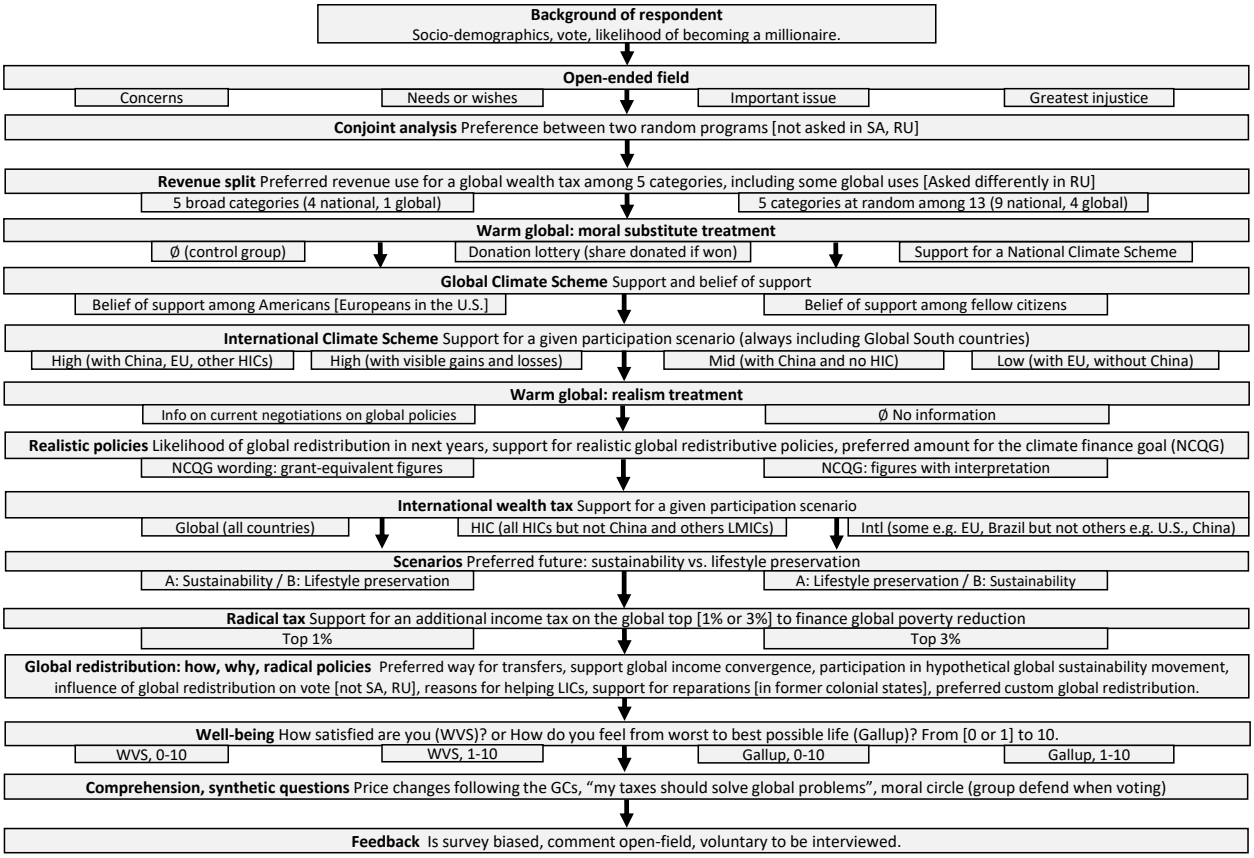
Incentives. The questionnaire includes three incentivized questions, each awarding a $100 prize to one randomly selected winner. First, a comprehension question about the Global Climate Scheme (GCS) checks whether respondents understand the policy's cost.

[5] At the end of the survey, 70% of the respondents find the survey politically unbiased.
[6] In Russia, the questionnaire is shorter and the cutoff is 200 seconds.

Second, a donation lottery allows respondents to choose what portion of the prize they would donate to a reforestation NGO, should they win. Third, a question assesses respondents' perception of the actual support for the GCS, rewarding a correct guess.

Survey Structure. While S.I. H provides the full questionnaire, Figure 2 depicts the survey flow with all random branches. The various treatments are independent and uniformly distributed. Whenever there is a treatment, the acceptance rates reported are computed using the control group. S.I. F runs placebo tests to check if earlier treatments affect unrelated outcomes.

Figure 2: Survey flow.



After collecting sociodemographic characteristics, the questionnaire begins with broad questions to assess the prioritization and salience of global solidarity before respondents

become aware of the survey topic. First, respondents answer open-ended fields on either their main concerns, wants, issues of interest, or perceived injustices. Second, they complete a conjoint experiment where they select their preferred political program, or abstain. Each program is randomly generated: each policy (or lack thereof) in five policy domains is selected at random from a pool of policies prominent in the country's public debate. Third, respondents allocate the revenue of a global wealth tax among five (national or global) spending items.

Then follow attitudinal questions about the main policies studied: a *Climate Scheme* at the national, global, or international level; an international wealth tax funding low-income countries; and ten plausible global solidarity policies. These questions include treatments that vary the international coverage of policies or test for warm glow.

The final part of the questionnaire explores attitudes towards more radical global redistribution scenarios and includes an interactive task in which respondents choose their preferred custom redistribution of global incomes by manipulating sliders. The survey concludes with a comprehension question, synthetic questions (e.g. regarding one's moral circle), and a feedback field.

Pre-registered Hypotheses and Data Availability. The project has been approved by the institutional review board and preregistered. The study did not deviate from the registration; the questionnaires and hypotheses tests used are the ones specified *ex ante*. All data, code, and figures are available at [anonymized for review].

3 Salience and Prioritization of Global Solidarity

In this section, I analyze the salience of global solidarity in undirected open-ended fields, and the prioritization of global programs in a budget allocation task.

3.1 Top-of-mind Considerations

At the beginning of the survey, respondents are randomly assigned one of four open-ended questions: their main concerns, their needs or wishes, an issue important to them but neglected in public debate, or the greatest injustice of all. The questions are deliberately broad and vague to let respondents express their top-of-mind considerations without any priming.

To analyze the answers, I automatically translated each field into English, then used AI and my own reading of a few hundred answers to identify the most common concepts, from which I selected 27 categories. I classified each answer into one or more of these categories, both manually (Figures S3-S6) and automatically using AI and keyword matching. The three classification methods yield consistent results but differ in accuracy. While the keyword classification allows for an exact and reproducible search, the AI search is not limited to specific words and captures more matching responses. Overall, manual classification provides the most accurate results, with the number of matches generally falling between those of the other two methods.

While less accurate than the classifications, word clouds (Figure 3) provide a simple visualization of the most common concepts in each question. By far, the most frequent *concerns* or *wishes* of respondents relate to their purchasing power, with concepts such as "money", "inflation", the "cost of living", or "financial stability" appearing in 31% of these fields. The next most frequent *concerns* are healthcare (13%), far-right governments (or related concepts such as "Trump" or "trade tariffs", 10%) and war (9%). Most *wishes* are personal, with the next most frequent (after money) relating to health (21%) or peace of mind (10%). Interestingly, almost none of the responses mention relational considerations, such as love, friendships, loneliness, or intimate life.

Asked about the greatest *injustice*, the most frequent answers relate to "inequality" or "poverty", with 19% of occurrences (28% in Europe but only 9% in the U.S.). It is unclear

Figure 3: Most common concepts in open-ended fields. (Questions 19-22)

(a) "What are your main concerns these days?"

(b) "What are your needs or wishes?"

(c) "What according to you is the greatest injustice of all?"

(d) "Can you name an issue that is important to you but is neglected in the public debate?"

whether these respondents are thinking about inequality in their own country or at the global level, since only 11% of them specify a geographical scope. One clue is that 2% mention their own country versus 10% the global level (or Global South issues such as "clean water" or "starvation"). Italians, Poles, and Spaniards are the most likely to men-

tion "global inequality" or "global poverty", while Japanese and Russian respondents are the least likely. The next most common answers relate to "discrimination" (based on gender, race, or sexual orientation, 9%), "violence" or "wrongful convictions" (9%), or their country's "welfare state" (either deficient public services or excessive nanny state, 8%).

Asking people about "an issue important to them but neglected in the public debate" fails to uncover unusual topics: 21% of respondents are unable to identify such an issue. The most frequently mentioned concepts are "public services" (12%), the "cost of living" (10%), "health" (9%), "ageing" (6%), the "environment" (6%), and "immigration" (5%). The fact that the most frequently mentioned topics are already publicized suggests that public debate reflects or shapes what people have in mind.

Reading and coding each field not only results in an arguably more accurate classification, but also offers insight into how people think. For example, most people reason from their own perspective (e.g. "my pension is too low", "I want to buy a house") and do not refer to the broader picture or to political reforms. Random selections of responses are displayed at [anonymized for review].

The topics mentioned vary according to sociodemographic characteristics. For example, a respondent who mentions *immigration* is 3.5 times more likely to vote for the far right (correlation of .17). Beyond this example, the strongest effects found are that *criticizing the far right* correlates with voting for the left (.16), mentioning *old age* with being 65 or older (.13), and *health* with age (.11).

Our topic of interest, *global inequality*, does not emerge as an issue salient to most people. Indeed, most considerations relate to issues that directly affect oneself or one's family, and political considerations (regarding e.g. public services, pensions, or taxes) are often framed at the national level. *Global redistribution* almost never appears as a *wish*. Furthermore, *global inequality* is rarely mentioned as a neglected *issue* or as a *concern*, in contrast to international issues such as war, climate change, or the rise of the far right.

However, it is mentioned as frequently as these other international issues in terms of *injustice*.

In summary, the low salience of global solidarity may explain why this topic fails to mobilize political forces, despite being referred to as a just cause and it being accepted by majorities (as shown below).

3.2 Prioritization of Public Spending Items

Fabre et al. (2025) find that 58% of Americans and 71% of Western Europeans would support a global tax on millionaires funding low-income countries (LICs), with only 26% and 14% opposing it, respectively. Meanwhile, around half of them would prefer to allocate half (rather than none) of the revenue from a global wealth tax to LICs. It seems that the more leeway respondents are granted to allocate the revenue from such a tax, the less they would allocate to LICs. The greatest leeway tested by Fabre et al. (2025) let respondents select their preferred share for LICs versus domestic healthcare and education, and the average preference was 33.4%—that is, 66.8% of an equal split. Naturally, one expects respondents to split the revenue among all desirable spending items, so if LICs compete with not one but several national items, the share allocated to LICs is expected to diminish. If this share is less than 67% of an equal split, it would mean that Fabre et al. (2025) overestimated the prioritization of LICs, perhaps due to the excessive salience of LICs when only one alternative is proposed.

To test this, I conduct a revenue allocation task with five spending items. In each of the two variants, respondents use sliders to allocate the revenue of a hypothetical global wealth tax (at a rate of 2% on wealth above $5 million), after being informed of the revenue it would collect in their country (from $1 billion in Poland to $514 billion in the U.S.) versus in all LICs combined ($1 billion).

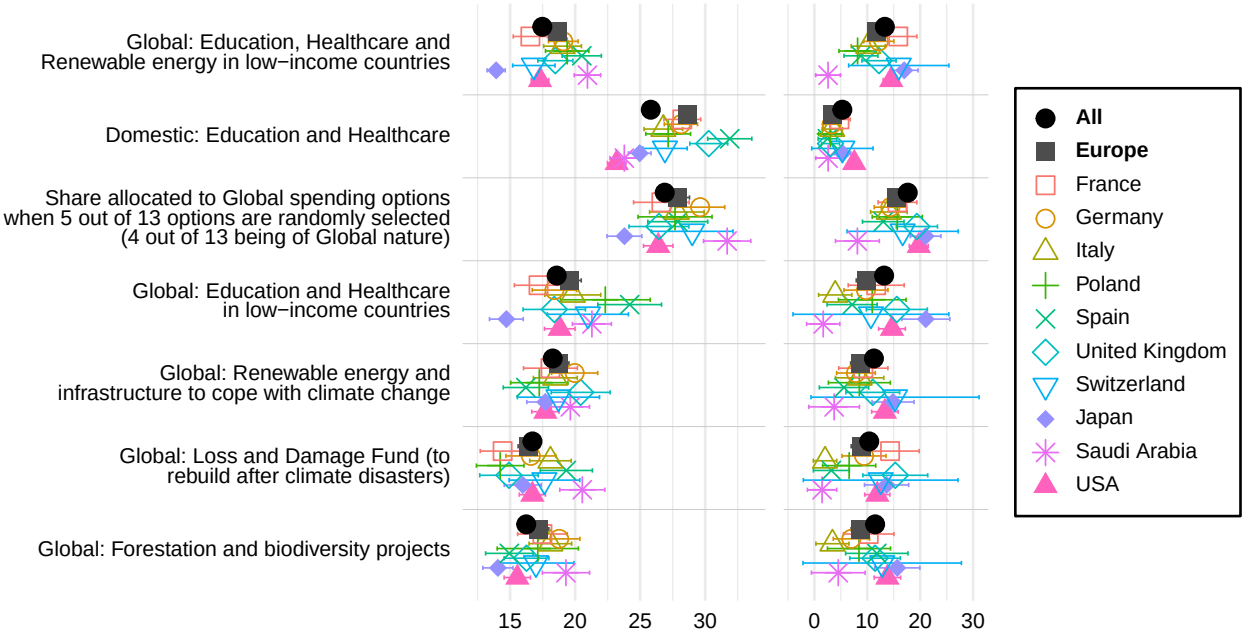
In the *Few* variant, one global item ("Education, Healthcare and Renewable energy in

LICs") competes with four domestic ones. In every country, the most prioritized item is "Domestic: Education and healthcare", with an average preferred share of 26% (Figures S9, S10). The global item is the least prioritized overall, at 17.5% (from 14% in Japan to 21% in Saudi Arabia and Spain). However, global spending is the second most prioritized item in Europe (19%) and Saudi Arabia. Furthermore, global spending is 31% higher than the expected 13.4% (that is, 66.8% of 20%)[7] and only 13% of respondents do not allocate any revenue to it (Figure 4).

Figure 4: Preferred split of revenue from a global wealth tax. The first two items are from the *Few* variant with 5 fixed items (the *Global* one and the most preferred one are displayed); the last four items are from the *Many* variant with 5 items taken at random out of 13 (the 4 *Global* ones are displayed). (Questions 24-25)

(a) Average preferred allocation (in %).

(b) Share of respondents allocating 0 revenue (in %).



In the *Many* variant, five items are selected at random from a pool of four global and

[7]The one-sided test that global spending is lower than 33.4% is rejected at the 1% threshold in all countries except Japan, where it is rejected at the 10% threshold. If one restricts the comparison to the countries surveyed by Fabre et al. (2025), the global item is allocated 17.8%, which is 34% more than expected. The most credible explanation for outperforming expectations is that the domestic item chosen by Fabre et al. (2025) was the preferred one. Indeed, the global item is allocated 68% of the "Domestic: Healthcare and Education" share, almost exactly as expected.

nine domestic items. While domestic healthcare (27%) and education (22%) are the most prioritized items, the average allocation for global items ranges from 16% for "Forestation and biodiversity projects" to 19% for "Education and Healthcare in LICs" (Figures 4, S11). On average, tasks include 1.5 global items, which together receive 26.9% of the revenue—again, equivalent to 17.5% per global item. Interestingly, there is no significant correlation between the number of global items and the average allocation per global item.[8]

Overall, the revenue allocation tasks validate and confirm the findings from Fabre et al. (2025). Most people would favor using a substantial share of the revenue from a global wealth tax to finance sustainable development in LICs, even though global spending is somewhat less prioritized than domestic spending.

4 Acceptance of Policies as a Function of Country Coverage

While acceptance of global climate or redistributive policies is widespread (Cappelen et al. 2025b; Fabre et al. 2025), acceptance may drop if policies are not truly *global* but only *international*, i.e. if key countries such as China, Russia, or the U.S. do not participate. Indeed, people may be concerned about a domestic loss of competitiveness resulting from the expatriation of taxpayers to low-tax jurisdictions; or about unfair burden-sharing if non-cooperating countries free-ride on decarbonization or sustainable development funding. In this section, I examine the acceptance of globally redistributive policies depending on the coalition of countries that would implement them. I study, in turn, a carbon price and a wealth tax.

[8]In Russia, the question could not be asked in the same way due to different software. Instead, respondents had to choose what share of the global tax revenue to allocate to sustainable development in low-income countries. On average, Russians allocate 12.2% to LICs, with a median allocation of just 5%, but only 12% allocate nothing to LICs.

4.1 International Climate Scheme

Presentation of the Schemes. "Cap and dividend" is a reference climate policy (Baer et al. 2000; Barnes et al. 2008; Bertram 1992; Blanchard & Tirole 2021; Grubb 1990), whereby fossil fuel companies at the source of emissions must buy emission permits on a carbon market, with the revenue from carbon pricing rebated equally to individuals. The limited and declining number of emission permits guarantees that emissions are capped according to the climate objective. As polluting companies pass the cost of emission permits down the value chain, the carbon price is ultimately paid by consumers in proportion to their carbon footprint. Meanwhile, the equal cash transfer (or "dividend") offsets price increases for the average consumer. Those with a higher-than-average carbon footprint financially lose, while those with a lower carbon footprint (who are on average poorer) financially gain.

Using simple *Yes*/*No* questions, I test the acceptance of three types of "cap and dividend" (or "Climate Scheme") policies that differ by geographical scope: the National, Global, and International Climate Schemes (Figures 6, S12). While average consumers in a high-income country are financially unaffected by the National Climate Scheme (NCS), they lose out in the Global and International versions, since their carbon footprint is larger than the world (or climate coalition) average.

The National Climate Scheme (NCS) is accepted by 68% of respondents (ranging from 56% in Poland to 88% in Saudi Arabia).[9]

The Global Climate Scheme. Before presenting the Global Climate Scheme (GCS), respondents are instructed to pay careful attention, with the incentive that they may win a $100 lottery prize if they correctly answer a comprehension question at the end of the sur-

[9]The acceptance of the NCS is higher than the support for a *tax*-and-dividend policy found in other surveys (Douenne & Fabre 2022; Mildenberger et al. 2022), 12 p.p. higher than in Dechezleprêtre et al. (2025). Indeed, most people prefer emissions trading schemes to carbon taxes (Funke et al. 2025).

vey. When presented with the Global Climate Scheme (GCS), respondents are informed that the cash transfer would lift 600 million people out of extreme poverty, and the cost to them is made salient. Respondents are informed of the amount of the cash transfer, as well as the price increases and the net cost to the average person in their country (e.g. 2% price increases and a net cost of $90 per month in the U.S., or 2% and €45 per month in Germany).[10] The GCS is accepted by 55% of respondents (from 49% in the U.S. and Russia to 85% in Saudi Arabia). The salience of costs in the GCS question may explain the somewhat lower acceptance of the GCS compared to the NCS.[11]

Pluralistic Ignorance. After assessing support for the GCS, respondents are asked in an incentivized way about their belief concerning the actual support, either in their country or in the U.S. (Figure S12).[12] In every country and for any variant of the question, actual support is underestimated. The median respondent underestimates the support in their own country by 16 p.p. and the support in the U.S. by 22 p.p. In Japan and in European countries, the underestimation is more severe, with most people wrongly believing that the GCS does not garner majority support in their country. Such pluralistic ignorance might explain why politicians do not dare to propose global climate justice policies.

Interestingly, support is strongly correlated with the perception of support: 51% of respondents who support the GCS perceive it as supported by at least 50% in their own country, compared to only 24% of those who do not support it.[13] In other words, in

[10]The computations use a carbon price of $95/tCO_2$. For Russia, Saudi Arabia, and the U.S., computations assume universal country coverage and the cash transfer is $35 per month. For Europe and Japan, the net loss is computed in a non-universal but *High* participation scenario, which implies a lower cash transfer (€20 per month) and a higher net cost (by about $10 per month) since the coalition's average carbon footprint is lower than the world average. S.I. H reports the country-specific figures.

[11]Acceptance of the GCS is also around 10 p.p. lower than in Fabre et al. (2025). There may be different reasons for this: attitudes may have changed in the two-year interval; and I added information on the price increases, which allows respondents to estimate the cost to themselves (rather than to their average fellow citizen).

[12]Americans are asked about either their country or the EU. In Russia, I was not permitted to enquire about beliefs regarding a foreign country.

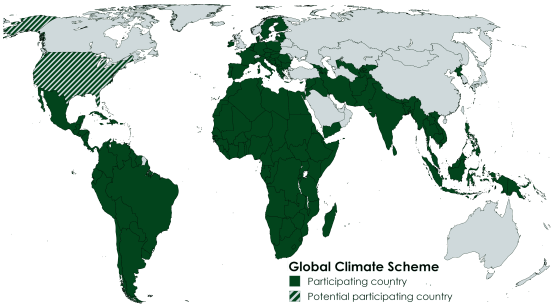
[13]The median perception of support in one's own country is 20 p.p. higher among those who support the

addition to pluralistic ignorance, there is a false consensus effect.

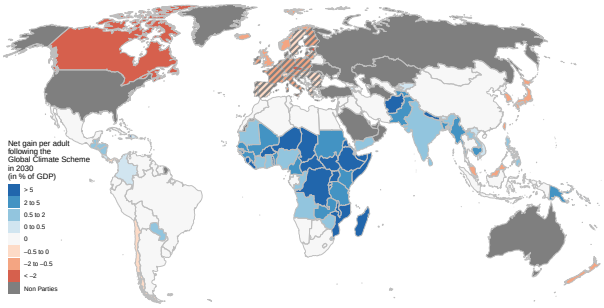
International Climate Scheme. To test how country coverage influences the acceptance of the International Climate Scheme (ICS), respondents are randomly assigned to one of four variants. They can visualize the country coverage on a map (see examples in Figure 5), where their own country is striped to denote its potential participation. Respondents are also informed of the number of countries that would participate, the list of these countries or world regions, and their share of world emissions.

Figure 5: Example maps of the International Climate Scheme question. (Question 35).

(a) *Low* variant for the U.S.



(b) *High color* variant for EU countries.



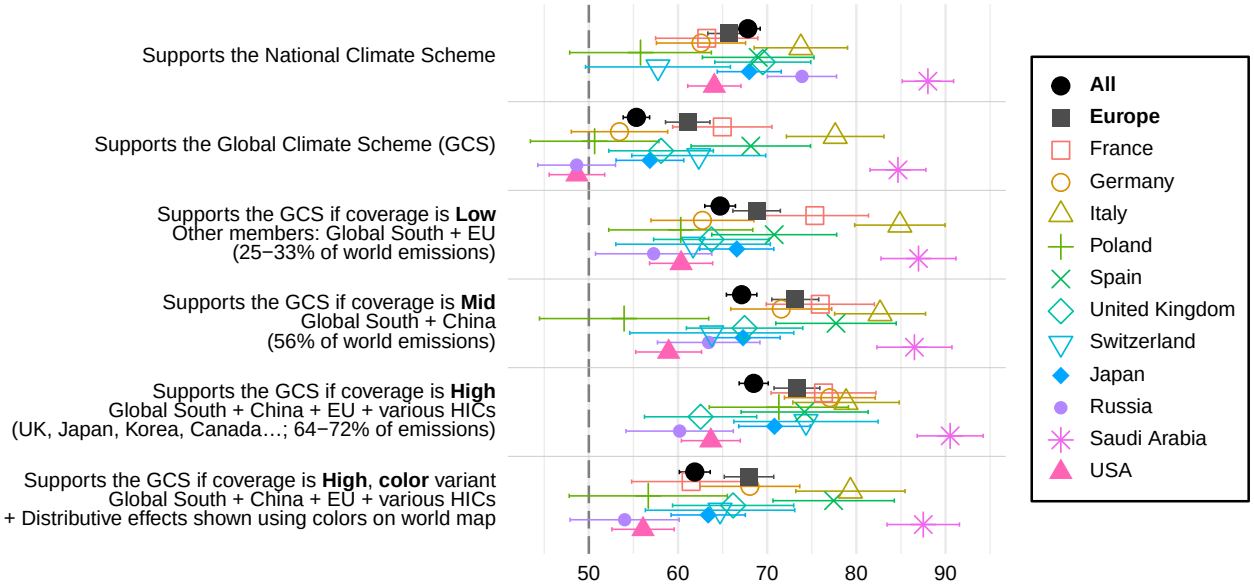
The *Mid* scenario covers 56% of world emissions and includes China and Global South countries. The *Low* scenario replaces China with the EU and covers 33% of emissions. The *High* scenario adds various high-income countries, including the EU, the UK, Japan, Canada, and South Korea, and covers 72% of emissions. The last variant, *High color*, combines the *High* participation scenario with a colored map displaying the net gain or cost for each country.

As expected, the wider the coverage, the higher the acceptance. However, this effect is relatively small: acceptance is only 3.8 p.p. higher in the *High* variant (at 68%) compared to the *Low* variant (65%).[14]

GCS (50% versus 30%). Reciprocally, support for the GCS reaches 72% among the 39% of respondents who believe that a majority in their country supports it, compared to 44% among those who do not.

[14]Interestingly, acceptance among Europeans significantly increases when China participates, but does

Figure 6: Percentage of support for the National, Global, and International Climate Schemes (*Yes*/*No* questions). (Questions 26-35.)



The effect of country coverage is entirely driven by the 74% of respondents who understand that the GCS would result in increased gasoline prices. It is worth noting that acceptance is higher among the minority of respondents who misunderstand the policy: by 5 p.p. for the GCS and 4 p.p. for the ICS.

Acceptance is 6.6 p.p. lower in the *High color* variant compared to the *High* variant. Three reasons may explain this. First, the cost may be more salient with the colored map. Second, some respondents may be concerned by the information (made explicit in the question) that China would neither gain nor lose from the policy.[15] Third, with the colored map, respondents learn how their own country fares compared to others; the effect is no longer significant for countries that appear to lose less than 0.5% of their GDP (Spain and Switzerland).

Notice that acceptance of the ICS in the *Low* coverage variant is similar to that of the

not rise further when adding other HICs. Conversely, for Americans and Japanese, only the *High* coverage significantly increases acceptance.

[15]Indeed, the GCS slightly departs from a standard cap and dividend in which China should lose since its carbon footprint exceeds the world average (Fabre 2025).

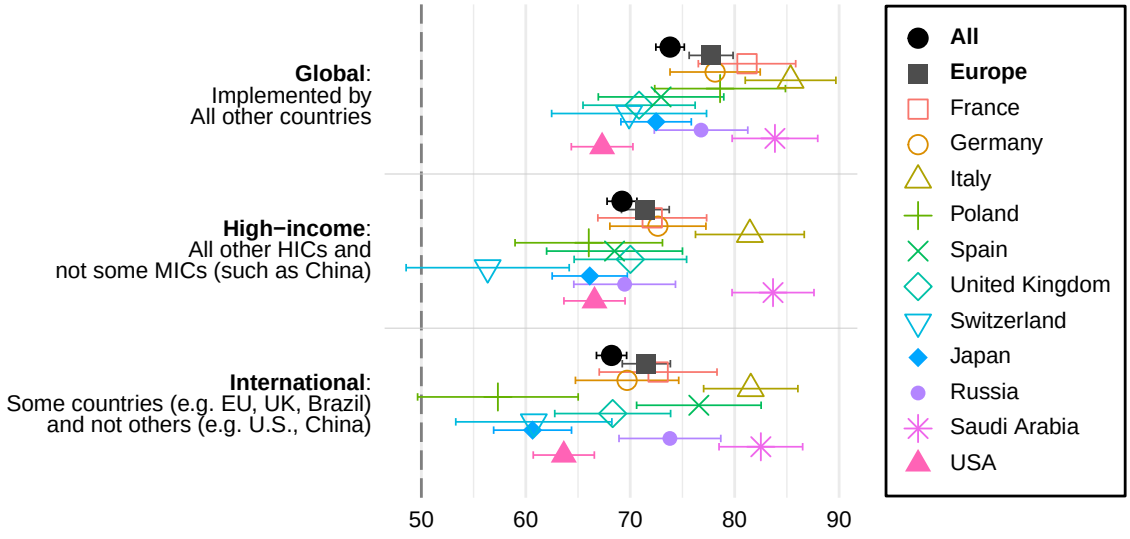
NCS. This suggests that the average respondent is willing to pay the ICS's higher cost for the guarantee of poverty alleviation and decarbonization in the Global South.

4.2 Wealth Tax Funding LICs

I test the effect of country coverage on the acceptance of an internationally redistributive wealth tax (2% on wealth above $1 million, with 30% of revenue financing public services in LICs) using a simple *Yes/No* question with three random variants: *Global* (all countries except the respondent's own), *HIC* (all HICs), and *International* (some countries, always including Brazil and European countries, excluding China and the U.S.).

Here again, acceptance increases with the country coverage, but the effect is small. The *HIC* variant garners 70% acceptance (from 58% in Switzerland to 81% in Saudi Arabia). Compared to *HIC*, acceptance is 4.8 p.p. higher with *Global* coverage, while it is only 1.4 p.p. and non-significantly lower with *International* coverage (Figure 7).

Figure 7: Percentage of support for an international wealth tax with 30% of revenue funding LICs, depending on the country coverage (*Yes/No* question). (Questions 41-43).



Overall, the results indicate that the acceptance of internationally redistributive policies is quite robust to country coverage. This confirms that the issues of competitiveness

or free riding are not decisive factors in public support (Aklin & Mildenberger 2020).

5 Sincerity of Support for Global Redistribution

Skeptics about the public's support for global redistribution would argue that this support is not reflected in real-stake decisions or that it mostly results from *warm glow*. According to the *warm glow* hypothesis, many people would express their support to enjoy moral comfort as long as the policy appears out of reach and supporting it seems harmless. In case of *warm glow*, support would vanish if (*i*) the prospect of implementation materialized or if (*ii*) moral comfort could be obtained from a substitute. In this section, I test whether global redistribution is a vote-determining issue using a conjoint analysis, and I test both forms of *warm glow* (*i* and *ii*) using two other survey experiments.

5.1 Conjoint Analysis

I conduct a conjoint experiment in all countries except Russia and Saudi Arabia. This question is positioned at the beginning of the survey, before respondents know the survey's topic. Respondents are presented with two random political programs, framed as the fictitious programs of the leading candidates in the next election, and are asked which candidate they would vote for (27% of the respondents choose the outside option *Neither of them*). Each program contains a policy or an absence of policy, chosen at random, for each of five policy domains (the order of which is also randomized). Our domain of interest is *Foreign policy*, whose pool contains three policies: *Cut development aid*, *International tax on millionaires with 30% financing healthcare and education in low-income countries*, and a country-specific policy. The other policies have been selected from the programs of the main candidates in the country's most recent election.

Figure 8 shows the effect of including our policies of interest in a program on the like-

lihood that it is preferred. More specifically, following Hainmueller et al. (2014), Figure 8 presents the results of the following regression, estimated by simple OLS with standard errors clustered by respondent:[16]

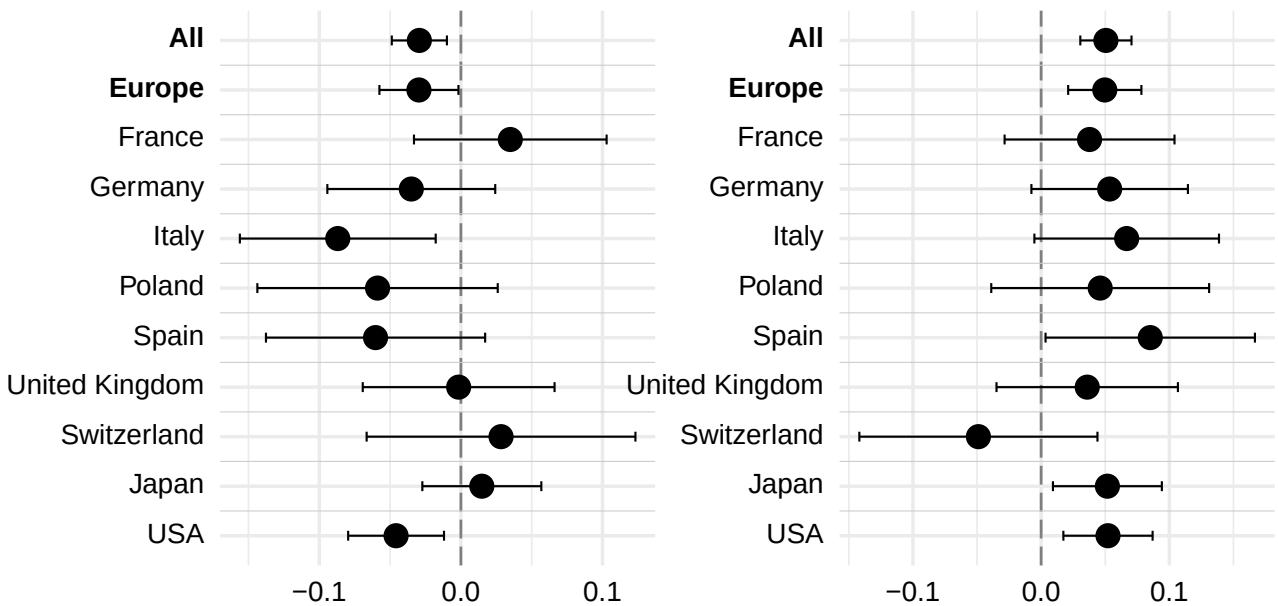
$$\text{Preferred}_{pi} = \beta_0 + \beta_1 \text{Cut_aid}_{pi} + \beta_2 \text{Intl_tax}_{pi} + \beta_3 \text{Foreign3}_{pi} + \varepsilon_{pi} \tag{1}$$

where pi denotes the program p faced by respondent i, and each variable is a dummy.

Figure 8: Effect on the likelihood that a political program is preferred of containing the following policies (compared to no foreign policy in the program). No control is included, 95% confidence intervals are shown. (Question 23)

(a) Cut development aid

(b) International tax on millionaires with 30% financing health and education in low-income countries



Both policies significantly affect program choice: the internationally redistributive millionaire tax increases the likelihood that a program is preferred by 5 p.p., while cut-

[16]The AMCE is the change in the probability that a program is chosen if a policy is present rather than not, averaged across all possible values in the other policy domains. I verify that the results are similar when using a conditional logit: the average marginal effects of *Int'l tax* and *Cut aid* are 6 p.p. and −3 p.p., respectively.

ting development aid decreases it by 3 p.p. At the country level, the effects are generally non-significant due to lack of power, but when significant, they are of the same sign as the global effect. On average, the effects of the tax are of similar size to the effects of other policies,[17] suggesting that certain global redistribution proposals may be as vote-determining as policies prominent in the national debate.

One concern with this type of conjoint analysis is that it involves unrealistic political programs that contain both left and far-right policies. De la Cuesta et al. (2022) showed that one should weigh each pair of programs by the probability that it would arise in a real election, hence excluding implausible programs. I classify each policy proposal according to its originating political party and re-estimate the regression after dropping the 29% of pairs with an inconsistent program (one containing policies from both the *left* and the *far right*). Effects are preserved: +5 p.p. for the tax and −3 p.p. for cutting aid, confirming the results are robust to this critique.

5.2 Testing Warm Glow

Some people might claim to support a policy of global redistribution merely to ease their conscience. If support were mainly due to this psychological mechanism, called *warm glow*, it might dissipate when the prospect of the policy materializes or if the policy support could be replaced by a substitute with the same moral appeal.

Moral Substitute. Following Nunes & Schokkaert (2003), warm glow would be revealed if support for the GCS decreased after respondents are offered the opportunity to express generosity towards the cause of climate change. To test this hypothesis, right before the GCS page, I assign a random subset of the respondents to a donation lottery,

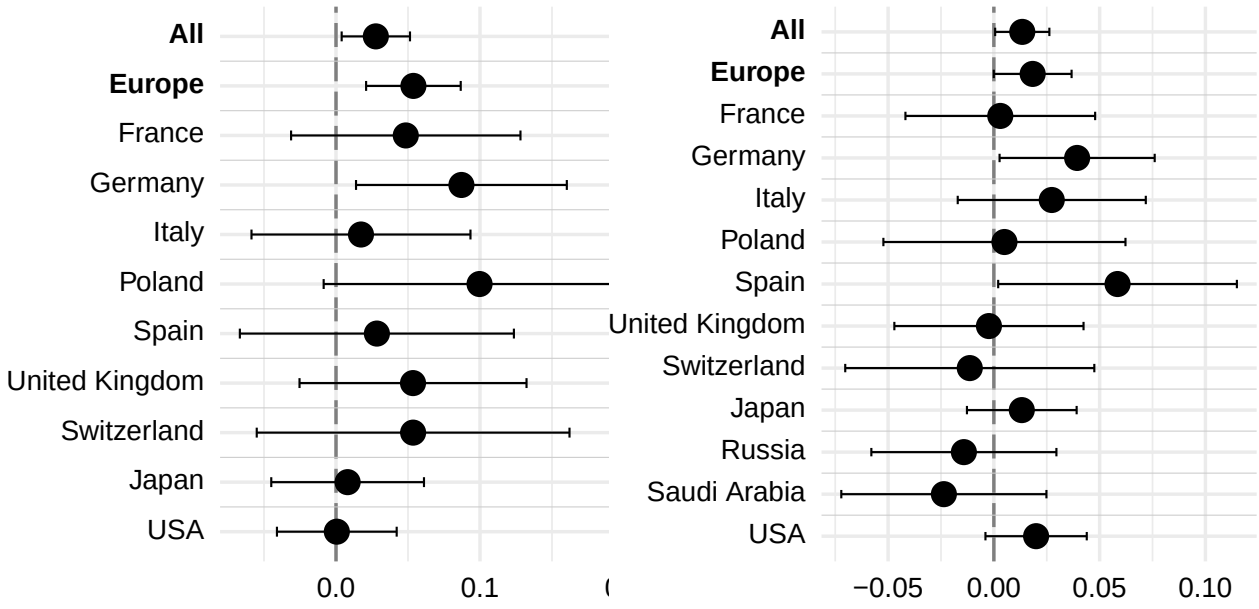
[17] A simple permutation test shows that the effects of *int'l tax* are not significantly lower than the average absolute effect size (it is just 4% lower, p=.48) but the effects of *cut aid* are significantly lower (p=.01).

while the control group faces no question.[18] In the *Donation* branch, respondents must decide how much they would donate to the reforestation NGO *Just One Tree*, should they win the question's $100 lottery. Lower support for the GCS in the treated group would be evidence of warm glow, or moral licensing, as it would indicate that the support derives (at least partially) from moral satisfaction at having recently supported a just cause.

Figure 9: Testing warm glow (negative effects would indicate the presence of warm glow). Regressions include controls, 95% confidence intervals are shown.

(a) Effect of a *Donation lottery* treatment on support for the Global Climate Scheme. (Questions 27-28)

(b) Effect of information about ongoing global redistribution initiatives on the share of plausible global policies supported. (Questions 36-38)



On the contrary, support for the GCS is 3 p.p. higher in the *Donation* branch compared to the control group, and the coefficient is positive in every country, though often not significant (Figure 9a). The results show no evidence of warm glow.

[18]More precisely, right before the GCS question, the sample is split into three branches: the *Donation* lottery, the *NCS* question, and the control group. The NCS treatment is excluded from this analysis as it is unrelated to this experiment (restricting the NCS question to a subsample was done to prevent it from influencing responses to the GCS).

Realism Treatment. To test the hypothesis that some people express support for global redistribution only as long as its implementation seems unlikely, I randomly assign half of the respondents to receive information about ongoing negotiations on globally redistributive policies. Among other things, treated respondents are informed that the International Maritime Organization recently adopted a levy on maritime carbon emissions that should partly finance LICs; that the G20 considered introducing a global tax on billionaires; that the UN General Assembly recently agreed on the principle of expanding the UN Security Council to new members; and that the UN Secretary-General supports financial system reforms that would drive resources towards sustainable development (see Question 36). Then, respondents are asked "how likely [it is] that international policies involving significant transfers from HICs to LICs will be introduced in the next 15 years", right before their support for ten plausible global policies is tested.[19] Here, warm glow would be revealed if the information treatment increased the belief that global redistribution is likely but decreased support for global policies.

The treatment was designed to satisfy the exclusion restriction required for the instrumental variables (IV) strategy: that the the treatment affects support for global policies only through its impact on beliefs that global redistribution is likely. Table 1 reports the corresponding regression results with sociodemographic controls. Informed respondents are 7 p.p. more likely to believe that global redistribution is likely, from a baseline of 33% in the control group. With an effective F-statistic of 67, this provides a strong first stage for the IV estimation. The local average treatment effect estimated by 2SLS is 18 p.p., indicating that believing global redistribution is likely causally *increases* the share of global policies supported. This estimate is consistent with the non-causal OLS coefficient of 15 p.p. and the direct effect of the treatment of 1 p.p. (see Figure 9b).

[19]Section 6.1 reports acceptance of these policies and the pre-registration plan describes the corresponding international negotiations.

Table 1: Effect on support for global redistribution of believing that it is likely.

	Believes global redistribution likely		Share of plausible global policies supported		
	IV 1st Stage	IV 1st Stage	IV 2nd Stage	OLS	Direct Effect
	(1)	(2)	(3)	(4)	(5)
Information treatment	0.077***	0.074***			0.013**
	(0.010)	(0.009)			(0.007)
Believes global redistribution likely			0.181**	0.145***	
			(0.086)	(0.007)	
(Intercept)	0.332***	0.078	0.216***	0.220***	0.230***
	(0.007)	(0.067)	(0.065)	(0.064)	(0.066)
Controls: sociodemos and vote		✓	✓	✓	✓
Effective F-statistic	65.04	67.09			
Observations	12,001	12,001	12,001	12,001	12,001
R^2	0.006	0.134	0.174	0.176	0.141

*Note: Robust standard errors (HC1) are reported in parentheses. *p<0.1; **p<0.05; ***p<0.01. As in S.I. C, control variables are: vote, gender, age, income, education, urbanity, likelihood of becoming millionaire, living with partner, employment status, foreign born, country region.*

Again, the effects go in the opposite direction to warm glow. In this case, increased support may stem from enhanced credibility of policies known to be discussed in international organizations. Overall, the results of these two experiments provide no evidence that support for global redistribution is affected by warm glow. On the contrary, they suggest that support is sincere and robust to the prospect of implementation or to the possibility of a moral substitute.

6 Breadth of Accepted International Policies

Knowing that some internationally redistributive policies are sincerely supported and may influence voting behavior, I now examine the range of international policies that could be accepted. In this section, I analyze, in turn, the support for global policies cur-

rently debated in the international community, as well as more radical proposals; I also assess broader willingness to defend global solidarity, analyze the preferred channels to transfer resources to LICs, and use a custom redistribution task to reveal the preferred extent of international transfers.

6.1 Acceptance of Currently Debated Global Policies

Plausible Global Policies. Figure 10 reveals the acceptance of plausible global policies (see Figure S13 for absolute support). These policies are deemed "plausible" because they are debated in international organizations, as detailed in the pre-registration plan. Almost every policy garners majority acceptance in each country. The only exception is the acceptance among Japanese respondents of a globally redistributive tax on carbon emissions from aviation, at 46%. This proposal has the most salient cost: a 30% increase in flight prices. The most supported policies, with over two-thirds acceptance in every country and a majority of absolute support in the pooled sample, are the 2% minimum tax on billionaires' wealth proposed by Zucman (2024), the expansion of low-interest-rate sustainable investments in LICs (Bridgetown Initiative 2025), and developed countries contributing to the climate loss and damage fund. Figure S29 shows that most policies garner majority support across the political spectrum in Europe and Japan, whereas Trump voters oppose more policies than they support (see also Figures S28-S30 for a breakdown of the main variables by political leaning and other selected sociodemographics).

Ranking of Countries. On average, respondents support 51% of the plausible policies and oppose 21% of them (+30 p.p. net support). The countries with the highest net support are Saudi Arabia (+50 p.p.), Italy (+49) and Spain (+39). In contrast, net support is lowest in Japan (+20), Switzerland (+24), Poland, and the U.S. (+25). Other synthetic indicators of support for global redistribution show consistent country rankings (Figure S1,

Figure 10: Acceptance of plausible global redistribution policies (Percentage of *Somewhat* or *Strongly support* among non-*Indifferent* responses). See Figure S13 for the absolute support. (Question 38).

	All	Europe	France	Germany	Italy	Poland	Spain	United Kingdom	Switzerland	Japan	Russia	Saudi Arabia	USA
Minimum tax of 2% on billionaires' wealth, in voluntary countries	81	84	87	83	89	79	81	85	77	81	80	86	77
Bridgetown initiative: MDBs expanding sustainable investments in LICs, and at lower interest rates	79	82	81	81	88	72	81	85	75	81	83	87	74
L&D: Developed countries financing a fund to help vulnerable countries cope with climate Loss and damage	75	75	72	73	84	72	77	72	67	73	87	89	70
International levy on shipping carbon emissions, returned to countries based on population	70	73	78	70	78	61	74	75	72	59	73	81	67
At least 0.7% of developed countries' GDP in foreign aid	70	69	66	67	79	59	77	65	64	62	83	86	67
Debt relief for vulnerable countries, suspending payments until they are more able to repay	70	70	64	60	81	79	72	72	65	68	75	88	67
Expand Security Council to new permanent members (e.g. India, Brazil, African Union), restrict veto use	69	76	72	76	80	73	76	78	72	68	53	84	67
NCQG: Developing countries providing $300 bn a year in climate finance for developing countries	68	69	68	69	76	63	73	67	65	59	88	86	61
Raise global minimum tax on profit from 15% to 35%, allocating revenues to countries based on sales	68	75	75	74	85	66	70	74	63	72	50	77	66
International levy on aviation carbon emissions, raising prices by 30%, returned to countries based on population	53	55	62	54	56	53	54	54	51	46	51	70	51

S.I. H).

Climate Finance Goal. In 2024, countries agreed on a "New Collective Quantified Goal" (NCQG) of climate finance set at $300 billion per year by 2035, which is triple the previous goal. [20] Currently, the goal is being met with only $26 billion in grants and the remainder in loans (OECD 2024).

I test the preferred amount for the NCQG in grant-equivalent terms, using two random variants. Both variants inform respondents of the current situation and the agreed goal. The *Short* variant uses qualitative, textual responses, and features a middle category of $100 billion. The *Full* variant provides more detailed explanations in the question text and then uses numerical answers, with a midpoint of $300 billion.

In both variants, the median preferred NCQG is $100 billion in grants (Figures S14-

[20] Climate finance refers to the financing of climate action in developing countries by developed countries.

S15), in line with the internationally agreed NCQG, suggesting that respondents' attitudes are anchored in existing agreements.

6.2 Support for Radical Proposals, Political Action, and Broad Values

In the final part of the questionnaire, I pose a variety of questions to assess the range of global solidarity policies, actions or values that people may accept (Figure 11).

Sustainable Future versus Status Quo. Respondents were asked which scenario they would prefer for the next twenty years: a sustainable future or the status quo (randomly labeled *A* or *B*). In the sustainable scenario, most countries cooperate to tax millionaires and meet the +2°C target, through the electrification of cars and the doubling of prices for heating fuel or gas, air travel, and beef. Although overall purchasing power is preserved (through a reduction in sales tax), people change their habits (e.g. flying and eating meat are cut by half). In the status quo, no policy is implemented, people maintain their lifestyles, and global warming reaches +3°C by 2100, causing more severe disasters. Overall, 68% of respondents prefer the sustainable future over the status quo.

Global Income Redistribution. I test the support for a global tax on top incomes to finance poverty reduction in LICs, with the tax targeting either the global top 1% or top 3%, depending on random assignment. The top 1% variant describes an additional 15% tax on after-tax individual income in excess of $120,000 per year (at Purchasing Power Parity), while the top 3% variant features additional rates of 15%, 30%, and 45% above $80,000, $120,000, and $1 million, respectively. Each tax is calibrated to finance the poverty gap, defined using thresholds of $250 and $400 per month, and entails international transfers of 2% and 5% of world nominal income, respectively.

Overall, 56% (resp. 50%) of the respondents support the top 1% (resp. top 3%) tax,

and 25% (resp. 28%) oppose it (Figure S18). The top 1% tax obtains majority of absolute support in every country except Japan. Both variants are accepted by a majority in every case except Switzerland for the top 3% variant. Overall, the tax garners majority acceptance even among the 6% of respondents who would be affected, though this is not the case in every country for the top 3% variant.

Global Convergence. A simple question captures the acceptance of global solidarity: "Should governments actively cooperate to have all countries converge in terms of GDP per capita by the end of the century?" Overall, 61% answer *Yes* and 26% *No*, with the lowest relative agreement in the U.S. at 56%.

Willingness to Act. Two questions asked the respondents how they would react to a "worldwide movement in favor of a global program to tackle climate change, implement taxes on millionaires and fund poverty reduction in [LICs]".

In a multiple-choice question (censored in Russia), 29% report they could participate in the movement by either attending a demonstration (19%), going on strike (7%), or donating $100 to a strike fund (10%). This share rises to 68% when including the 52% of respondents who "could sign a petition and spread ideas" (Figure S2). Interestingly, 52% of the 561 millionaires who answered would be in favor of such a movement.

When asked whether they would be more or less likely to vote for the political party they feel closest to if it were part of such a movement, 36% of the respondents state they would be more likely versus 17% less likely (Figure S19).[21]

Reasons for Helping LICs. In a multiple-choice question, I asked respondents which reasons for HICs supporting LICs they agree with, among arguments involving *duty*,

[21] Among the 5% of respondents who did not vote in the last election and feel closest to a left-wing party, the share more likely to vote in that case increases to 46% (versus 10% who are less likely).

long-term interest, or *historical responsibility*. At 54%, the reason most frequently chosen in every country (except France) is *duty*, specifically "Helping countries in need is the right thing to do" (Figure S20). Additionally, 38% select *interest*, and 25% *responsibility*, with only 16% disagreeing with every reason.

Reparations. In former colonial or slave States, only a minority of 35% of respondents support "reparations for colonization and slavery to former colonies and descendants of slaves", specifying that the reparations "could take the form of funding education and facilitating technology transfers", while 42% oppose them (Figure S21). for its advocates.

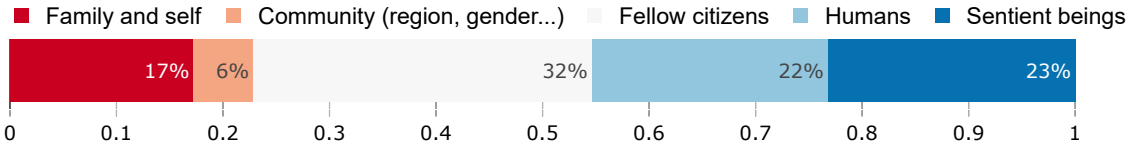
Agreement That Own Taxes Should Solve Global Problems. Overall, 41% agree and 28% disagree that "[their] taxes should go towards solving global problems". As explained in Section 2, the present results replicate well the "Global Solidarity Report" that first asked this question (Global Nation 2023)

Figure 11: Acceptance of broad action or radical proposals of global redistribution. (Questions 44-46, 49-51, 53, 61).

	All	Europe	France	Germany	Italy	Poland	Spain	United Kingdom	Switzerland	Japan	Russia	Saudi Arabia	USA
Accepts tax on world top 1% to finance global poverty reduction (Additional 15% tax on income over [$120k/year in PPP])	69	73	71	72	84	69	73	67	60	69	75	82	62
Accepts tax on world top 3% to finance global poverty reduction (Additional 15% tax over [$80k], 30% over [$120k], 45% over [$1M])	64	66	70	62	71	70	66	67	42	55	76	82	57
Prefers sustainable future	68	70	72	70	76	58	73	68	66	76	69	72	62
"Governments should actively cooperate to have all countries converge in terms of GDP per capita by the end of the century"	70	78	77	76	87	85	84	66	66	70	78	93	56
Would support a global movement to tackle CC, tax millionaires, and fund LICs (either petition, demonstrate, strike, or donate)	68	72	70	69	82	71	74	68	63	56	56	73	67
More likely to vote for party if part of worldwide coalition for climate action and global redistribution	68	72	72	71	82	64	77	69	57	56	NA	NA	67
Accepts reparations for colonization and slavery in the form of funding education and technology transfers	45	50	44	44	69	NA	51	46	NA	NA	NA	NA	40
"My taxes should go towards solving global problems"	59	61	43	62	77	63	70	58	53	59	57	89	55
"My taxes ... global problems" (Global Nation, 2023)	56	59	43	65	76	58	60	52	NA	76	NA	NA	44

Moral Circle. Asked "Which group of people do you advocate for when you vote?",[22] 45% select a universalist answer ("Humans" or "Sentient beings (humans and animals)"), which is more than the most common answer, referring to one's fellow citizens (32%). Universalists are fewer in Japan (30%) but constitute a majority in Europe (50%) and Saudi Arabia (57%), as shown in Figures 12 and S24. Among those who lean to the left, 59% are universalists, compared to 32% on the center-right or far-right.

Figure 12: "Which group of people do you advocate for when you vote?"[22] (Question 62).



6.3 Preferred Channels for Transferring Resources to LICs

Asked to evaluate ways of transferring resources to reduce poverty in LICs, the most preferred option in every country is "Cash transfers to parents (child allowances), to the disabled and to the elderly", with 49% selecting it as a *Right way* or *Best way* (Figure 13).[23] "Unconditional transfers to the national government" is the only option seen as a *Wrong way* by the majority, but this share falls from 51% to 21% when "transfers to the national government [are] conditioned on the use of funds for poverty reduction programs".

6.4 Custom Global Income Redistribution

The last task of the questionnaire allowed respondents to manipulate the shape of the global income distribution.[24] The question text included the following instructions:

[22] In Russia and Saudi Arabia, the question was asked differently: "Which group do you advocate for? For example, if you were the richest person on Earth, which group would you predominantly help with your money?"

[23] Carson et al. (2025) find similar results surveying Global South countries.

[24] S.I. H details how I obtained the world distribution of PPP incomes.

Figure 13: "How do you evaluate each of these channels to transfer resources to reduce poverty in LICs?" Percentage of *Right* or *Best way*. (Question 48).

	All	**Europe**	France	Germany	Italy	Poland	Spain	United Kingdom	Switzerland	Japan	Russia	Saudi Arabia	USA
Targeted cash transfers (child allowances, disability & elderly pensions)	49	48	43	46	57	45	54	44	47	36	65	73	45
Development aid agencies	37	42	42	47	39	32	44	43	44	36	23	57	37
Government, conditional on financing poverty reduction	37	40	39	43	48	33	41	37	35	27	34	62	35
Unconditional cash transfers to each household	34	30	31	27	31	30	34	27	32	24	54	62	31
Local NGOs with democratic processes	29	33	39	33	34	33	33	29	32	22	17	53	29
Local authorities	22	23	25	22	22	30	23	19	19	18	19	47	22
Government, unconditional	18	18	21	14	18	22	21	16	14	14	18	50	18

> "Below you will find a graph of the world distribution of after-tax income and three sliders that vary it. The current distribution is in red, and your custom one is in green. The first two sliders control the proportion of winners and the proportion of losers, among all humans. The third slider controls the degree of redistribution from the richest to the poorest. If you do not want new policies to reduce global inequality, you can set the third slider to zero."

The interactive question is available at [anonymized for review] and the algorithm translating slider positions into a redistribution is described in the pre-registration plan. Figure 14 displays what respondents see below the instructions. Given the complexity of the task and its inconvenience on mobile devices, respondents are given the explicit option to skip it.

Overall, 56% are satisfied with their custom redistribution and 43% skip it. Although the non-response rate may seem high, it is relatively evenly spread across the population: the share of satisfied respondents is 52% for non-voters, 54% for center-right or right-wing voters, 57% for far-right voters, and 61% for left-wing voters.

Figure S22 shows the median preferred redistribution among satisfied respondents,

Figure 14: Custom global redistribution: screenshot of the bottom of the page. (Question 55).

Examples of income changes after your proposed redistribution:

Now	After
0 $/year	2 215 $/year
10 000 $/year	10 115 $/year
60 000 $/year	55 793 $/year

Proportion of winners: 60% Proportion of losers: 20%

Degree of redistribution: 2

☐ I am satisfied with my custom redistribution.

☐ I want to skip this question.

i.e. the curve obtained by setting the sliders at their median preferred values: 49% of winners, 18% of losers, and a degree of redistribution of 5/10, resulting in a transfer of 5.4% of world income from rich to poor and a minimum income of $287 per month. Interestingly, 48% choose to lose from their custom redistribution while only 9% choose to win. The average preferred redistribution (Figure S23) transfers 5.4% of world income from the top 27% to the bottom 73% and entails a minimum income of $247 per month.[25]

7 Conclusion

Applying the theory of optimal taxation, Kopczuk et al. (2005) show that the level of U.S. foreign aid could only be rationalized if the U.S. government placed a value 2,000 times higher on the welfare of an American than on that of a foreigner.[26] Our results contradict the notion that government action accurately reflects attitudes towards global redistribution, and are consistent with a conservative bias among legislators (Broockman & Skovron 2018; Gilens & Page 2014; Pilet et al. 2024). Indeed, a majority of respondents in high-income countries support a global tax on top incomes to finance poverty reduction in low-income countries. Additionally, over two-thirds of respondents accept a tax on the wealth of millionaires with 30% of the revenue financing LICs, even in the case of only a few countries implementing it. In every country, majorities accept an International Climate Scheme that is costly to them but beneficial to the poorest globally.

The revenue allocation task sheds light on how much people value global versus domestic public goods. On average, respondents allocate 17.5% of the revenue from a hypothetical global wealth tax to sustainable development out of the five specified categories.

[25] At the top of the distribution, the average preferred redistribution can be achieved with a 7% marginal income tax rate above $25,000 and a 16% rate above $40,000 per year (at Purchasing Power Parity). The average (resp. median) preferred redistribution would reduce the world Gini index from .67 to .59 (resp. .58), the D9/D1 ratio from 42 to 11 (resp. 10), and would increase the bottom 50% share from 8% to 13%.

[26] This is assuming effective transfers: the ratio should be reduced by the proportion of foreign aid transfers diverted or wasted.

This indicates that people are neither selfless universalists nor devoid of altruism towards foreigners. The custom redistribution task confirms that most people would actually prefer much greater global redistribution than currently exists, as the average respondent opts for a global minimum income of $247 per month, financed by transfers amounting to over 5% of world income.

An exploration of respondents' underlying values reveals that support for global redistribution primarily stems from a sense of duty and empathy towards the destitute. For some, this issue appears important enough to factor into their voting decision. Indeed, the likelihood that a political program is preferred increases if it includes a globally redistributive tax on millionaires and decreases if it includes cuts to foreign aid. Additionally, one-third of respondents report that they would be more likely to vote for a political party if it were part of a global movement for sustainable development, and a similar proportion state that they could themselves participate in such a movement.

These results raise the question of why so few policymakers campaign on sustainable development proposals. The lack of supply of such campaigns might stem from pluralistic ignorance among policymakers and activists, consistent with the public's underestimation of support for a Global Climate Scheme. Alternatively, it could be due to a lack of demand from constituents. Indeed, global inequality is rarely a top-of-mind consideration. People's most frequent concerns relate to self-interested issues such as purchasing power or health; articulated political demands generally refer to national issues; and the most salient international issues are climate change, wars, and the rise of the far right.

The low salience of global inequality may manifest as a lack of popular mobilization, resulting in it being a low priority for policymakers. Combined with the necessary trade-off between global redistribution and fellow citizens' purchasing power, policymakers may prioritize the latter to the point of ignoring universalist attitudes. Status quo bias is a compounding factor: the weakness of global institutions and the primacy of national poli-

ties make international cooperation unlikely, which may discourage universalist thought and make it seem utopian. Indeed, support for global policies is partly caused by the belief that they are possible, as our information experiment demonstrated. Therefore, the world order based on nation-states might silence demands for universalist reforms and perpetuate a cycle where the low salience of universalist concerns and status quo institutions reinforce each other.

Nevertheless, the survey results suggest some untapped potential for global solidarity. It is unlikely that the public would resist global redistribution policies. This is especially true for balance sheet operations with expansionary impacts and indirect costs, such as debt restructuring, liquidity provision, the expansion of lending by Multilateral Development Banks, and their recapitalization through the rechanneling of Special Drawing Rights. These reforms are widely accepted and are the natural focus of multilateral initiatives (Bridgetown Initiative 2025; FfD4 2025). Since public attitudes do not appear to be a limiting factor, further research is needed to understand policymakers' motivations and the obstacles they face in cooperating on sustainable development reforms.

Figure S12: Support for the National, Global, and International Climate Schemes, and median belief regarding the support for the GCS. (Questions 26-35). (Back to Section 4.1.)

	All	Europe	France	Germany	Italy	Poland	Spain	United Kingdom	Switzerland	Japan	Russia	Saudi Arabia	USA
Supports the National Climate Scheme	68	66	63	63	74	56	69	70	58	68	74	88	64
Supports the Global Climate Scheme (GCS)	55	61	65	53	78	51	68	58	62	57	49	85	49
Belief about GCS support in own country	39	40	40	35	40	35	40	42	45	33	30	58	40
Belief about GCS support in the U.S. (except for the U.S.: support in the EU)	30	21	20	19	24	29	23	21	20	30	NA	46	40
Supports the GCS if its other members* cover 25−33% of world emissions *Low: Global South + EU	65	69	75	63	85	60	71	64	62	67	57	87	60
Supports the GCS if its other members* cover 56% of world emissions *Mid: Global South + China	67	73	76	72	83	54	78	67	64	67	63	87	59
Supports the GCS if its other members* cover 64−72% of world emissions *High: Global South + China + EU + various HICs (UK, Japan, South Korea, Canada...)	68	73	76	77	79	71	74	63	74	71	60	91	64
Supports the GCS if its other members* cover 64−72% of world emissions *High color: High + Distributive effects displayed using colors on world map	62	68	61	68	79	57	77	66	65	63	54	88	56
Inflation due to the GCS (in %)	2	1	1	2	1	2	1	1	1	2	2	3	2
Net monetary cost of the GCS (in $/month)	52	27	17	48	18	39	13	24	14	48	30	101	88

Figure S13: Absolute support for plausible global redistribution policies (Percentage of *Somewhat* or *Strongly support*). See Figure 10 for the relative support. (Question 38).

	All	Europe	France	Germany	Italy	Poland	Spain	United Kingdom	Switzerland	Japan	Russia	Saudi Arabia	USA
Minimum tax of 2% on billionaires' wealth, in voluntary countries	63	70	75	71	73	63	66	70	64	54	57	67	61
Bridgetown initiative: MDBs expanding sustainable investments in LICs, and at lower interest rates	56	60	56	61	72	47	57	63	61	45	58	70	54
L&D: Developed countries financing a fund to help vulnerable countries cope with climate Loss and damage	55	58	55	55	68	55	61	56	52	44	61	75	52
Debt relief for vulnerable countries, suspending payments until they are more able to repay	49	52	48	44	64	53	55	54	52	38	52	70	48
At least 0.7% of developed countries' GDP in foreign aid	49	51	50	48	59	42	58	50	51	33	59	69	47
Raise global minimum tax on profit from 15% to 35%, allocating revenues to countries based on sales	49	58	58	57	70	47	50	58	51	42	35	53	46
NCQG: Developing countries providing $300 bn a year in climate finance for developing countries	48	53	51	54	62	46	54	52	53	32	60	67	44
International levy on shipping carbon emissions, returned to countries based on population	47	54	59	49	62	45	54	53	56	30	46	60	46
Expand Security Council to new permanent members (e.g. India, Brazil, African Union), restrict veto use	46	56	54	54	64	50	55	55	54	35	35	63	44
International levy on aviation carbon emissions, raising prices by 30%, returned to countries based on population	37	43	47	42	45	39	42	41	42	26	34	53	36

Figure S14: Preferred North-to-South climate grant funding in 2035, specified in qualitative terms or in terms of who advocates for that amount (NCQG, variant *Short*). (Question 40). (Back to Section 6.1.)

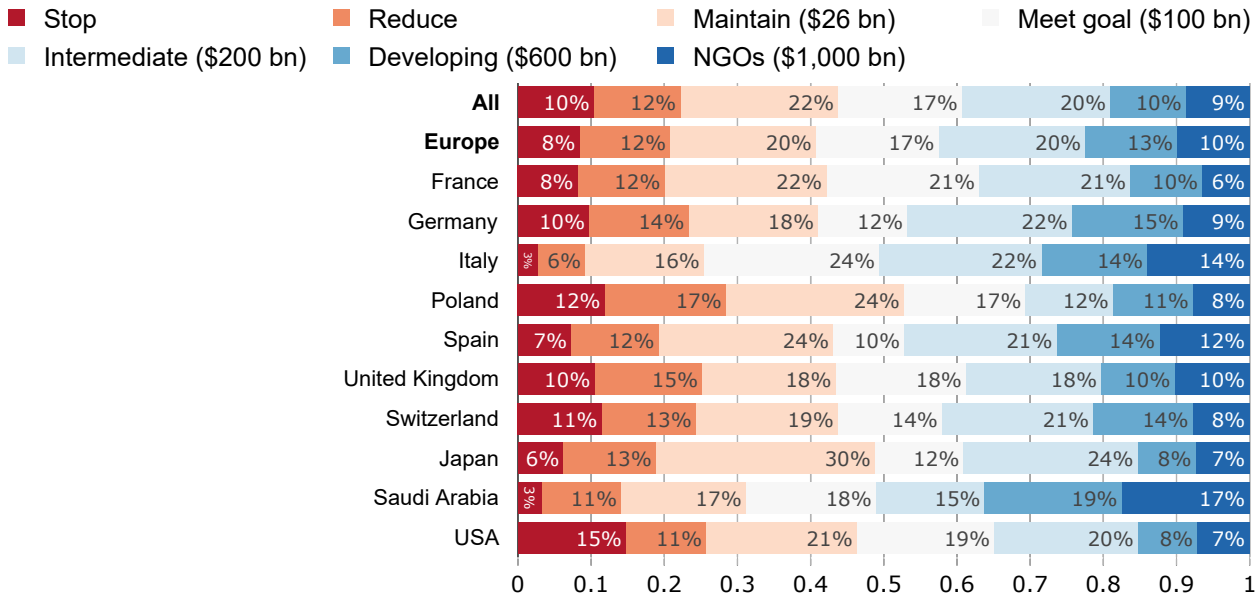

Figure S15: Preferred North-to-South climate grant funding in 2035, specified in money terms (NCQG, variant *Full*). (Question 39). (Back to Section 6.1.)

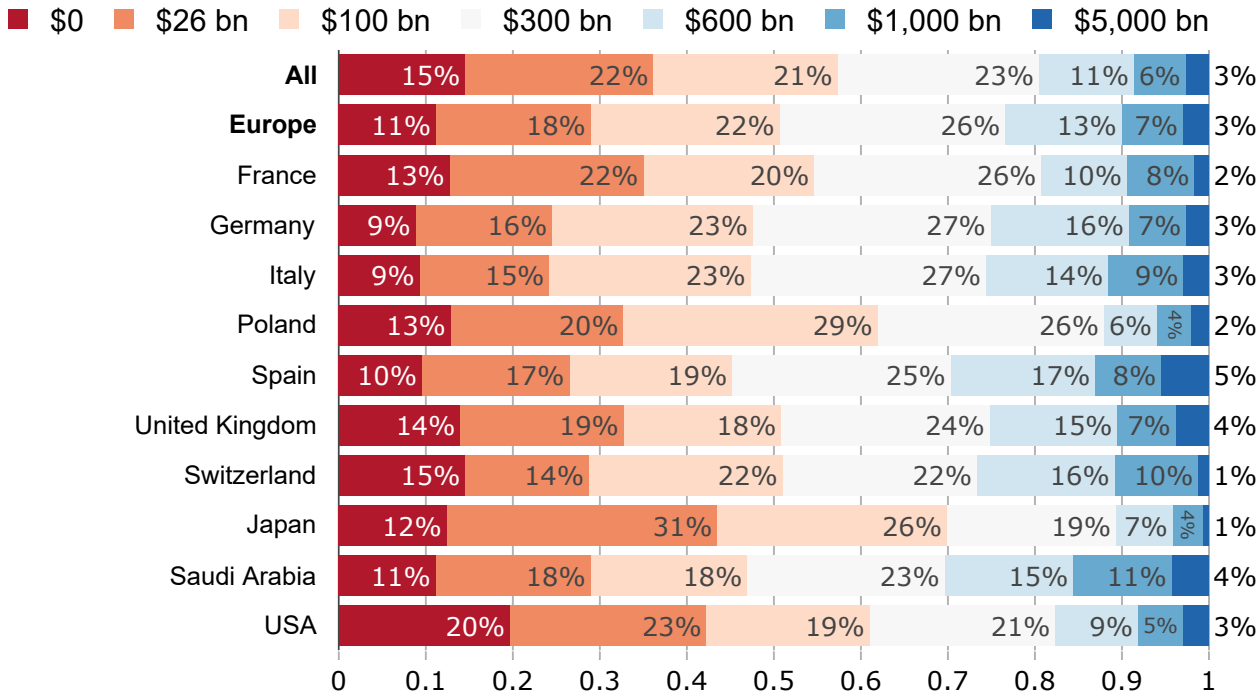

Figure S16: Acceptance of a global progressive income tax on the richest households to finance poverty reduction in the Global South (Percentage of *Somewhat* or *Strongly support* among non-*Indifferent* responses). (Questions 45-46).

	All	Europe	France	Germany	Italy	Poland	Spain	United Kingdom	Switzerland	Japan	Russia	Saudi Arabia	USA
Supports tax on world top 1% to finance global poverty reduction (Additional 15% tax on income over [$120k/year in PPP])	69	73	71	72	84	69	73	67	60	69	75	82	62
Supports tax on world top 3% to finance global poverty reduction (Additional 15% tax over [$80k], 30% over [$120k], 45% over [$1M])	64	66	70	62	71	70	66	67	42	55	76	82	57

Figure S17: Acceptance of a global progressive income tax on the richest households to finance global poverty reduction (Questions 45-46, Percentage of *Somewhat* or *Strongly support* among non-*Indifferent* responses), and features of the tax presented to the respondents (Section H). (Back to Section 6.2.)

	All	Europe	France	Germany	Italy	Poland	Spain	United Kingdom	Switzerland	Japan	Russia	Saudi Arabia	USA
Accepts tax on world top 1% to finance global poverty reduction (Additional 15% tax on income over [$120k/year in PPP])	69	73	71	72	84	69	73	67	60	69	75	82	62
Percentage of fellow citizens affected by top 1% tax	5	3	2	4	2	2	2	4	4	4	2	11	8
Percentage of GDP transferred abroad in top 1% tax	2	1	1	2	1	1	1	1	1	1	2	5	3
Accepts tax on world top 3% to finance global poverty reduction (Additional 15% tax over [$80k], 30% over [$120k], 45% over [$1M])	64	66	70	62	71	70	66	67	42	55	76	82	57
Percentage of fellow citizens affected by top 3% tax	11	6	5	10	5	4	5	5	18	10	4	16	18
Percentage of GDP transferred abroad in top 3% tax	5	3	2	4	3	4	3	3	3	4	5	12	8

Figure S18: Absolute support for a global progressive income tax on the richest households to finance global poverty reduction (Percentage of *Somewhat* or *Strongly support*). (Questions 45-46). (Back to Section 6.2.)

	All	Europe	France	Germany	Italy	Poland	Spain	United Kingdom	Switzerland	Japan	Russia	Saudi Arabia	USA
Supports tax on world top 1% to finance global poverty reduction (Additional 15% tax on income over [$120k/year in PPP])	56	61	62	62	75	50	61	55	53	44	60	68	51
Supports tax on world top 3% to finance global poverty reduction (Additional 15% tax over [$80k], 30% over [$120k], 45% over [$1M])	50	56	59	53	60	55	57	54	36	35	61	67	45

Figure S19: "Let us call "your political party" the party you voted for in the last election, or the party that represents your views most closely.
Imagine there was **a worldwide coalition** of political parties in favor of a common program **to tackle climate change, implement taxes on millionaires and fund poverty reduction in low-income countries**.

Would you be more likely to vote for your party if it were part of that coalition?" (Question 51). (Back to Section 6.2.)

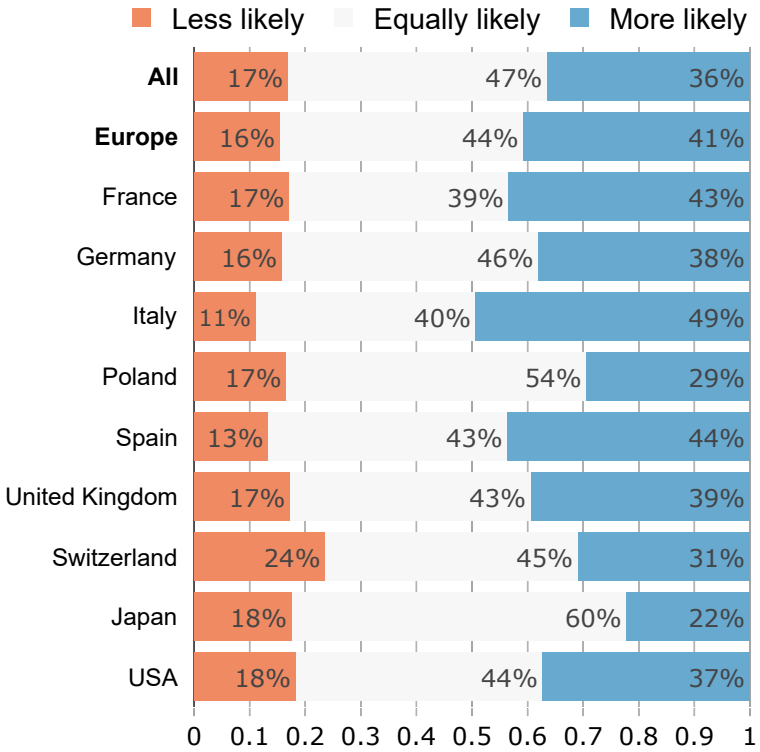

Figure S20: "Some people think that high-income countries should support low-income countries.
Among the different reasons given, which ones do you agree with? (Multiple answers possible)" (Question 52). (Back to Section 6.2.)

	All	Europe	France	Germany	Italy	Poland	Spain	United Kingdom	Switzerland	Japan	Russia	Saudi Arabia	USA
Responsibility: Historical responsibility of HICs for situation in LICs	25	28	28	28	30	27	32	26	28	17	26	32	22
Interest: Long−term interest of HICs to help LICs	38	42	45	47	45	38	36	40	39	33	37	42	34
Duty: Helping countries in need is the right thing to do	54	53	43	58	54	48	59	56	56	45	53	58	57
None of the above	16	14	20	13	8	10	10	19	15	22	12	7	20

Figure S21: "Some people argue that Western countries owe reparations for colonization and slavery to former colonies and descendants of slaves.
Reparations could take the form of funding education and facilitating technology transfers, to address unequal opportunities passed down from the past.

Do you support or oppose reparations of this kind **for colonization and slavery?** "
(Question 53). (Back to Section 6.2.)

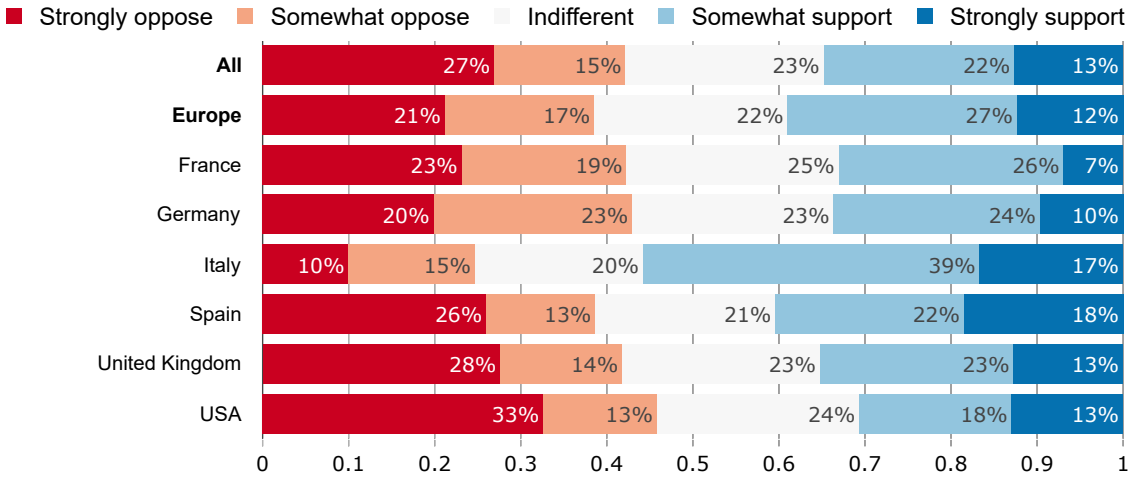

Figure S22: Global redistribution obtained from median custom parameters: 49% of winners; 18% of losers; degree of redistribution of 5 (out of 10). (Question 55). (Section 6.4.)

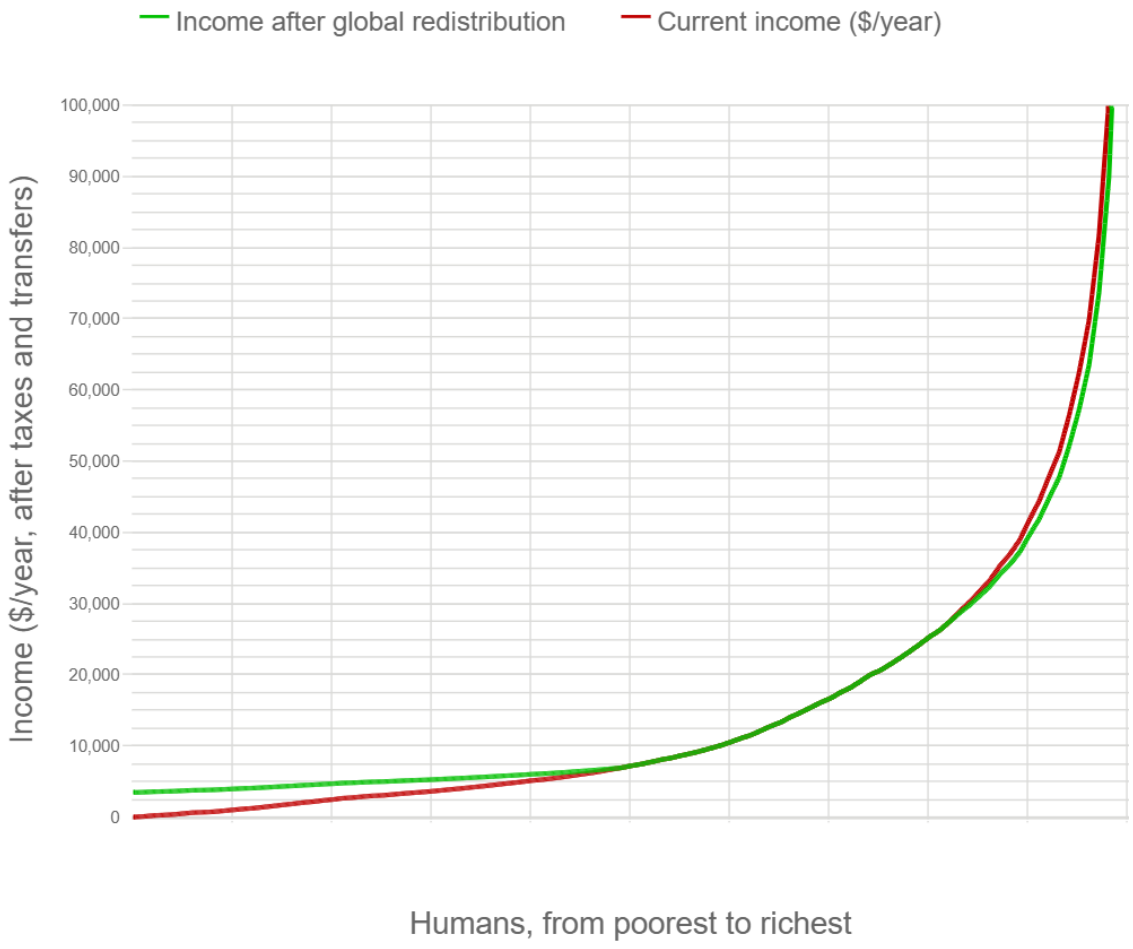

Figure S23: Average custom global redistribution. (Question 55). (Back to Section 6.4.)

Figure S24: "Which group of people do you advocate for when you vote?"[22] (Question 62). (Back to Section 6.2.)

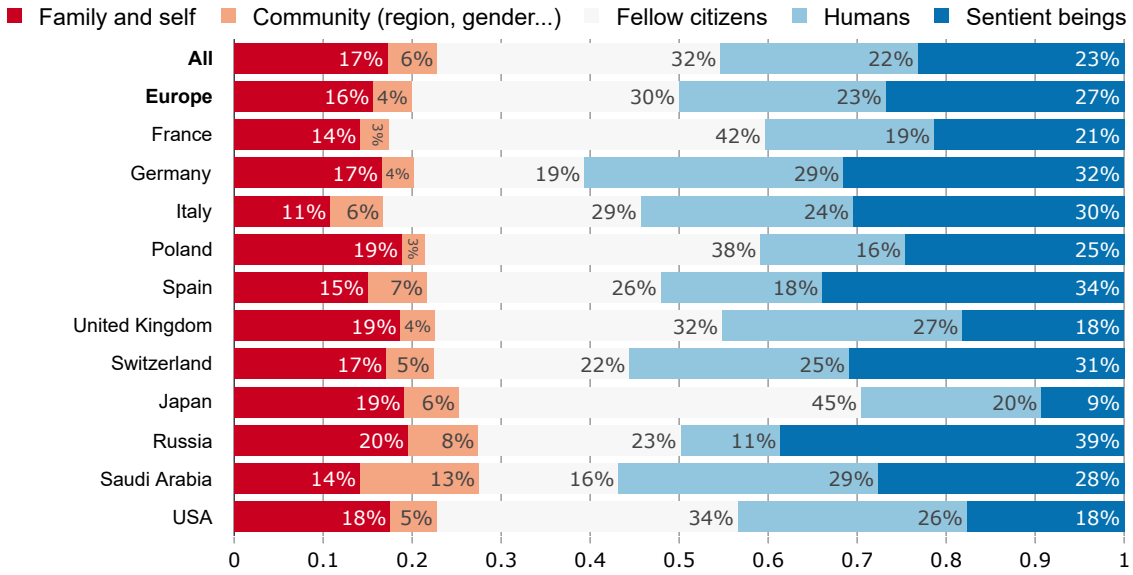

Figure S25: "Do you feel that this survey was politically biased?" (Question 63). (Back to Section 2.)

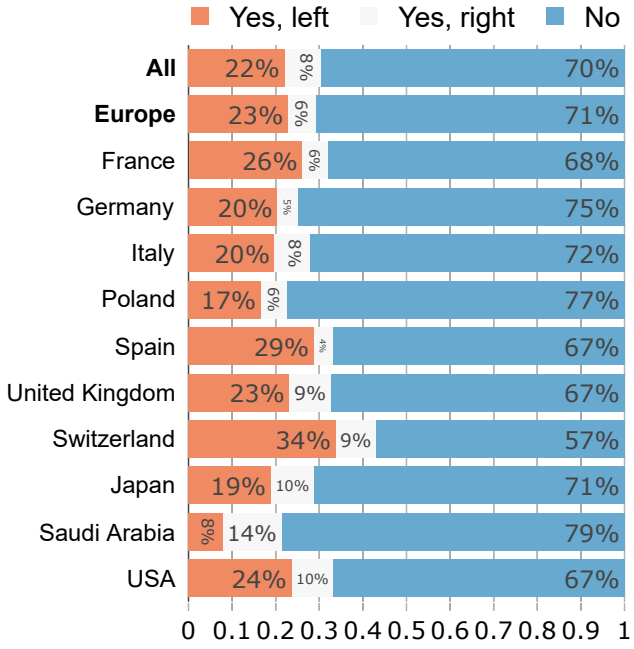

Figure S26: Vote in the last election, compared to actual results among voters. (Questions 16, 18). (Back to Section 2.)

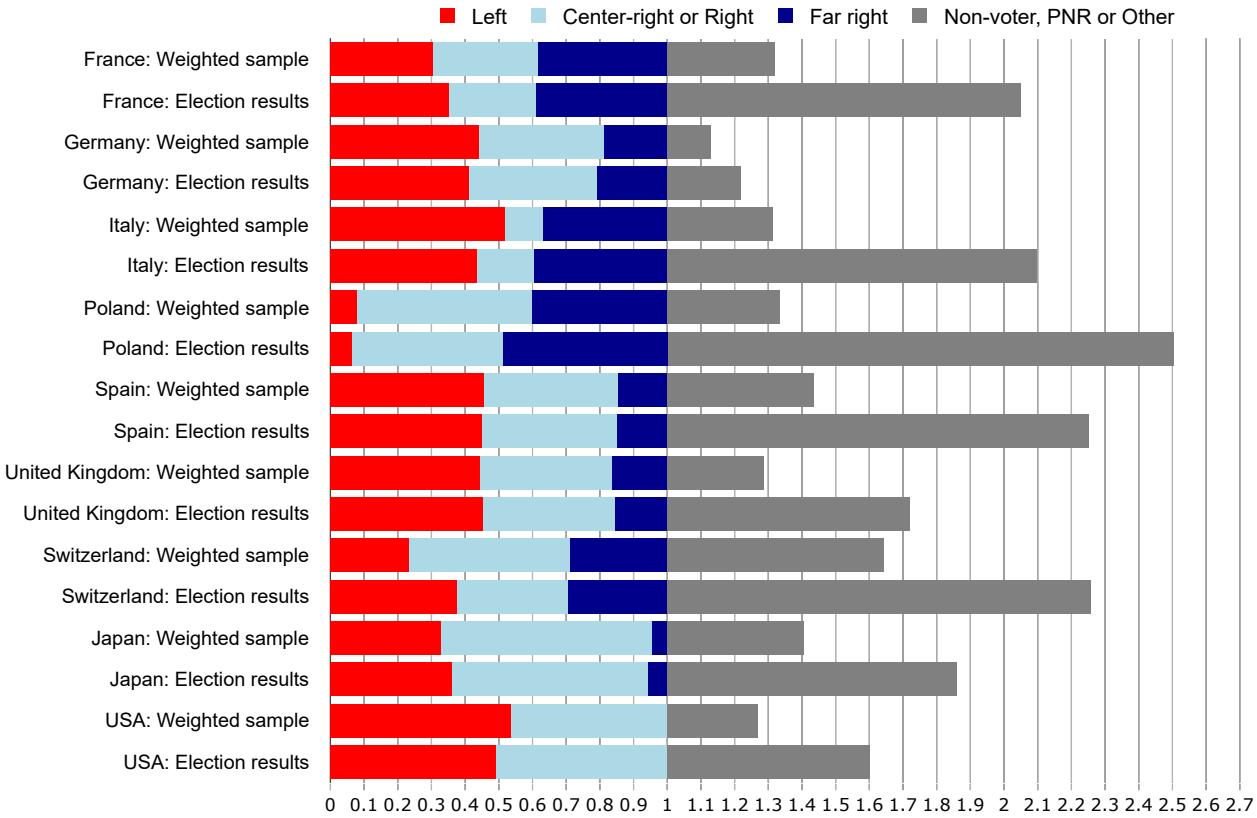

B Representativeness of the Surveys

Table S1: Sample representativeness overall, in Europe, and in the European Union.

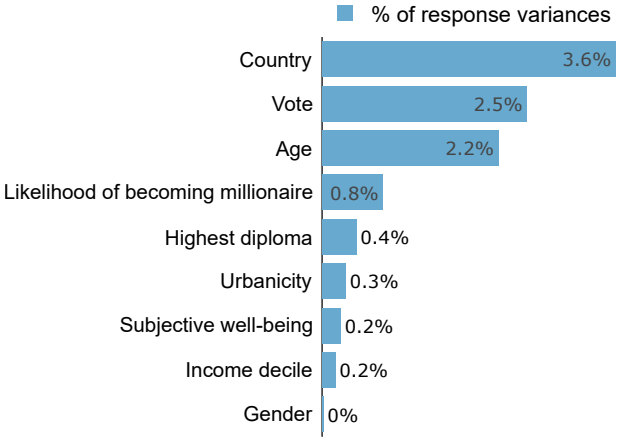
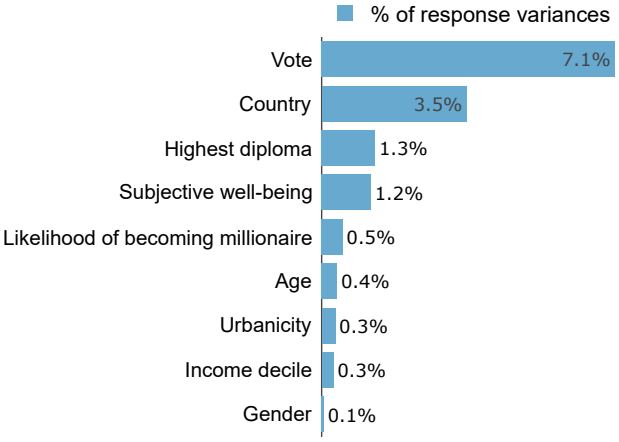
C Determinants of Support

Figure S27: Variance decomposition: share of the variance explained by each covariate ("Group defended when voting" is present only in bottom subfigures.).

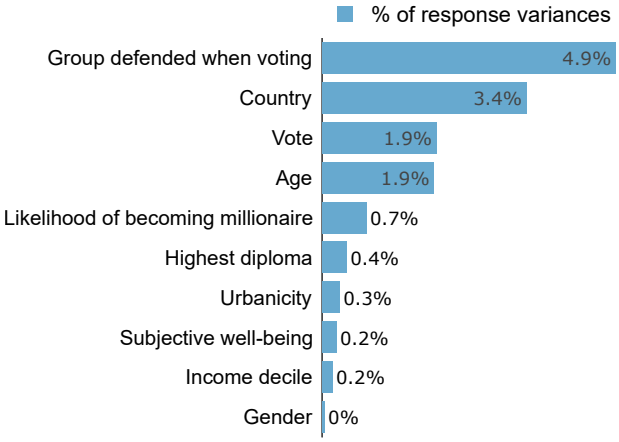
(a) Support for the Global Climate Scheme (10% of the variable's variance is explained by this linear model). (Question 28)



(b) Share of plausible global policies supported (15% of the variable's variance is explained by this linear model). (Question 38)



(c) Support for the Global Climate Scheme (14% of the variable's variance is explained by this linear model). (Question 28)



(d) Share of plausible global policies supported (20% of the variable's variance is explained by this linear model). (Question 38)

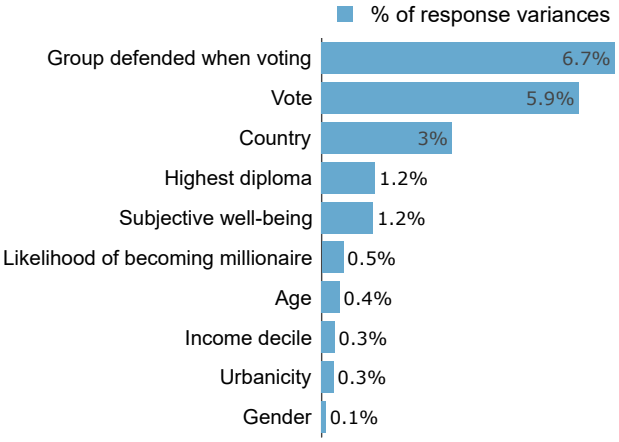


Table S5: Correlates of support for global redistribution (multivariate OLS regressions).

	Share of plausible policies supported	Supports the Global Climate Scheme	Universalist (Group defended: *Humans* or *Sentient beings*)	More likely to vote for party in global coalition	Endorses convergence of all countries' GDP p.c. by 2100	Supports an international wealth tax funding LICs	Prefers a sustainable future

	(0.009)	(0.007)	(0.006)	(0.005)	(0.006)	(0.008)
Observations	11,839	11,000	11,000	12,001	11,993	11,993
R^2	0.001	0.00004	0.00001	0.0001	0.001	0.001

Note: *p<0.1; **p<0.05; ***p<0.01

Table S10 shows that in two cases (out of thirteen), treatments are significantly correlated with unrelated outcomes later in the survey, with an effect size up to 3 p.p. While these framing effects are undesirable, their magnitude is limited. Indeed, the average value of affected outcomes always remain within ±2 p.p. of the value it is estimated to have had if any treatment had been generalized. (Back to Section 2.)

G Main Results on Selected Demographics, Including Vote

Figure S28: [On selected vote or nationality] Support for global redistribution action/policies.

	All	Europe Non−voters	Europe Left	Europe Center/Right	Europe Far right	Japan Non−voters	Japan Left	Japan Center/Right	Saudi Arabia	Saudi citizens	U.S. Non−voters	U.S. Harris	U.S. Trump
Supports the National Climate Scheme	68	65	80	64	47	69	69	70	88	91	64	79	50
Global climate scheme (GCS)	55	61	77	60	46	48	61	57	85	85	54	58	35
Supports Int'l Climate Scheme (any variant)	66	67	85	71	55	61	75	69	88	91	63	75	43
Supports int'l tax on millionaires with 30% funding LICs (any variant)	70	72	89	68	59	60	74	68	83	83	69	79	50
Supports tax on world top 1% to finance global poverty reduction (Additional 15% tax on income over [$120k/year in PPP])	56	58	81	50	48	36	51	45	68	74	50	64	37
Supports tax on world top 3% to finance global poverty reduction (Additional 15% tax over [$80k], 30% over [$120k], 45% over [$1M])	50	51	72	50	44	34	46	31	67	74	46	57	34
Prefers sustainable future	68	68	83	70	54	74	81	76	72	70	67	78	43
"Governments should actively cooperate to have all countries converge in terms of GDP per capita by the end of the century"	70	79	88	75	66	73	73	69	93	94	69	69	44
Would support a global movement to tackle CC, tax millionaires, and fund LICs (either petition, demonstrate, strike, or donate)	68	71	89	64	58	43	70	58	73	74	64	83	47
More likely to vote for party if part of worldwide coalition for climate action and global redistribution	36	35	61	33	27	16	31	22	NA	NA	28	52	27
Supports reparations for colonization and slavery in the form of funding education and technology transfers	35	39	54	30	24	NA	NA	NA	NA	NA	31	45	17
"My taxes should go towards solving global problems"	41	38	61	40	30	28	38	33	67	70	36	54	27

(Back to Section 2.)

Figure S29: [On selected vote or nationality] Acceptance of plausible global redistribution policies (Percentage of *Somewhat* or *Strongly support* among non-*Indifferent* responses).

	All	Europe Non−voters	Europe Left	Europe Center/Right	Europe Far right	Japan Non−voters	Japan Left	Japan Center/Right	Saudi Arabia	Saudi citizens	U.S. Non−voters	U.S. Harris	U.S. Trump
Minimum tax of 2% on billionaires' wealth, in voluntary countries	81	84	94	81	74	82	87	77	86	85	81	93	56
Bridgetown initiative: MDBs expanding sustainable investments in LICs, and at lower interest rates	79	77	93	86	63	77	86	80	87	87	78	92	52
L&D: Developed countries financing a fund to help vulnerable countries cope with climate Loss and damage	75	72	87	78	53	72	77	72	89	90	75	88	45
International levy on shipping carbon emissions, returned to countries based on population	70	70	87	72	56	57	64	59	81	84	68	86	47
At least 0.7% of developed countries' GDP in foreign aid	70	69	83	71	45	56	66	66	86	87	68	84	46
Debt relief for vulnerable countries, suspending payments until they are more able to repay	70	71	83	67	52	69	74	66	88	90	74	81	47
Expand Security Council to new permanent members (e.g. India, Brazil, African Union), restrict veto use	69	73	87	79	59	64	72	68	84	85	70	86	45
NCQG: Developing countries providing $300 bn a year in climate finance for developing countries	68	67	85	71	44	51	66	60	86	87	67	83	34
Raise global minimum tax on profit from 15% to 35%, allocating revenues to countries based on sales	68	70	89	69	65	70	77	71	77	76	66	84	45
International levy on aviation carbon emissions, raising prices by 30%, returned to countries based on population	53	48	71	53	40	43	49	47	70	73	48	67	34
